Despite extensive disclosure requirements, mutual fund investors do not observe all actions of fund managers. We estimate the impact of unobserved actions on fund returns using the return gap - the difference between the reported fund return and the return on a portfolio that invests in the previously disclosed fund holdings. We document that unobserved actions of some funds persistently create value, while such actions of other funds destroy value. Our main result shows that the return gap predicts fund performance.

Kelly, Sara. "Older Workers Dissatisfied with Traditional Financial Advice Model" *Plan Sponsor*.

Discussion of Hearts and Wallets Study. May 2011.

[http://www.plansponsor.com/Older\\_Investors\\_Dissatisfied\\_with\\_Traditional\\_Financial\\_Advice\\_Model.asp](http://www.plansponsor.com/Older_Investors_Dissatisfied_with_Traditional_Financial_Advice_Model.asp)

Introduction: Older investors are unhappy with the traditional advice and guidance model, in which one pays for advice on investment selection, but receives planning **advice as a "free" bonus**. Research from Hearts and Wallets found that some investors would prefer to pay for personalized planning advice. The study, "Addressing the Elephant in Financial Services: Insights into How Older Investors Really Want to Receive, and Pay for, Investment and Personal Financial Advice," found investors need help and want a reliable source to trust with their concerns.

Klein, Benjamin and Keith Leffler. "The Role of Market Forces in Assuring Contractual Performance", *Journal of Political Economy*, 1981

Abstract: The conditions under which transactors can use the market (repeat-purchase) mechanism of contract enforcement are examined. Increased price is shown to be a means of assuring contractual performance. A necessary and sufficient condition for performance is the existence of price sufficiently above salvageable production costs so that the nonperforming firm loses a discounted stream of rents on future sales which is greater than the wealth increase from nonperformance. This will generally imply a market price greater than the perfectly competitive price and rationalize investments in firm-specific assets. Advertising investments thereby become a positive indicator of likely performance.

Koch, Christopher and Carsten Schmidt. "Disclosing Conflicts of Interest-Do Experience and Reputation Matter" *Accounting, Organizations and Society* Vol. 35, 2010. (REPLICATES Cain, Loewenstein and Moore)

Abstract: In a controlled laboratory experiment, we investigate the effects of disclosing conflicts of interest on the reporting behaviour of information providers. First, we replicate the findings of Cain, Loewenstein, and Moore (Cain, D.M., Loewenstein, G., & Moore, D.A. (2005). The dirt on coming clean: Perverse effects of disclosing conflicts of interest. *Journal of Legal Studies* 34, 1–25) that such disclosure can trigger more biased reporting, since it removes moral concerns. Second, we show that this effect diminishes or even reverts with experience and reputation. Third, we observe that non-disclosure can have the positive effect of facilitating the formation of reputation.

Kramer, Marc. "Investment Advice and Individual Investor Portfolio Performance," January 2009.

Available at SSRN: [http://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=1341945](http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1341945)

Abstract: We aim at answering the question whether financial advisors add value to individual investor portfolio decision making. We do so by comparing portfolio performance of advised and self-directed (execution-only) investors using a large dataset of Dutch investors. Although the portfolios of advised and self-directed investors differ remarkably, we do not find any evidence of significant outperformance or underperformance of advised investors.

Krausz, Miriam, Jacob Paroush. "Financial Advising in the Presence of Conflict of Interests" *Journal of Economics and Business*. 2002.

Abstract: In this paper we study the conflict faced by a financial advisor in allocating an investor's wealth between a risky asset and the riskless asset. The investor is dependent on the financial advisor's information for making an allocation decision while the financial advisor can give deceptive information according to her interests in these assets. The results show how the level of deception is affected by the investor's characteristics, represented by wealth and attitude towards risk, by the characteristics of assets, represented by riskiness and by the market structure represented by level of competition.

Kuhle, James and Ralph Pope. "A Comprehensive Long-Term Performance Analysis of Load vs. No-Load Mutual Fund" *Journal of Financial and Strategic Decisions*. Volume 13, No. 2, Summer 2000.

Abstract: The debate between no-load and load funds has continued and has become more complicated because of the innovative packaging by mutual fund managers. The purpose of this research is to analyze whether load funds earn a consistently higher rate of return on a long-term basis when compared to no-load funds. This research evaluates the returns of equity load and no-load funds by analyzing the descriptive statistics of a large sample (8,100) of load and no-load funds. Results, summary statistics, and conclusions are drawn from the samples analyzed.

Kuhle, James and Ralph Pope. A Comprehensive Long-Term Performance Analysis of Load vs. No-Load Mutual Funds. *Journal of Financial and Strategic Decisions*. Volume 13, Number 2, Summer 2000.

Abstract: The debate between no-load and load funds has continued and has become more complicated because of the innovative packaging by mutual fund managers. The purpose of this research is to analyze whether load funds earn a consistently higher rate of return on a long-term basis when compared to no-load funds. This research evaluates the returns of equity load and no-load funds by analyzing the descriptive statistics of a large sample (8,100) of load and no-load funds. Results, summary statistics, and conclusions are drawn from the samples analyzed.

Lin, Hsiou-Wei and Maureen McNichols. Underwriting relationship, analysts' earnings forecasts and investment recommendations. *Journal of Accounting and Economics*, Vol. 25, 1998.

Abstract: We examine the effect of underwriting relationships on analysts' earnings forecasts and recommendations. Lead and co-underwriter analysts' growth forecasts and recommendations are significantly more favorable than those made by unaffiliated analysts, although their earnings forecasts are not generally greater. Investors respond similarly to lead underwriter and unaffiliated 'Strong buy' and 'Buy' recommendations, but three-day returns to lead underwriter 'Hold' recommendations are significantly more negative than those to unaffiliated 'Hold' recommendations. The findings suggest investors expect lead analysts are more likely to recommend 'Hold' when 'Sell' is warranted. The post-announcement returns following affiliated and unaffiliated analysts' recommendations are not significantly different.

Ljungqvist, Alexander, Felicia Marston, Laura Starks, Kelsey Wei and Hong Yan. "Conflicts of interest in sell-side research and the moderating role of institutional investors" *Journal of Financial Economics* 2007 Vol. 85.

Abstract: Because sell-side analysts are dependent on institutional investors for performance ratings and trading commissions, we argue that analysts are less likely to succumb to investment banking or brokerage pressure in stocks highly visible to institutional investors. Examining a comprehensive sample of analyst recommendations over the 1994–2000 period, we find that analysts' recommendations relative to consensus are positively associated with investment banking relationships and brokerage pressure but negatively associated with the presence of institutional investor owners. The presence of institutional investors is also associated with more accurate earnings forecasts and more timely re-ratings following severe share price falls.

Loewenstein, George, Daylian Cain, and Sunita Sah. "Pitfalls and Potential of Disclosing Conflicts of Interest," *American Economic Review*, May 2011.

Abstract: We review evidence from our published and ongoing research that disclosing conflicts of interest has unintended consequences, helping conflicted advisors and harming their advisees: With disclosure, advisors feel comfortable giving more biased advice, but advisees do not properly adjust for this and generally fail to sufficiently discount biased advice. Disclosure also increases pressure on advisees to comply with advice; following disclosure, advisees feel more uncomfortable in turning down advice (e.g., it signals distrust of the advisor's motives). Finally, we examine the effectiveness of policy interventions aimed at reducing these unintended consequences and discuss how to realize potential benefits of disclosure.

MacLeod, Bentley . "Reputations, Relationships, and Contract Enforcement. *Journal of Economic Literature*, Vol XLV, September 2007.

Abstract: When the quality of a good is at the discretion of the seller, how can buyers assure that the seller provides the mutually efficient level of quality? Contracts that provide a bonus to the seller if the quality is acceptable or impose a penalty on the seller if quality is unacceptable can, in theory, provide efficient incentives. But how are such contracts enforced? While the courts can be used, doing so involves high real costs. Informal enforcement, involving a loss of reputation and future access to the market for any party that defaults on a contract, may often be a better alternative. This paper explores the use of both formal and informal enforcement mechanisms, provides a rationale for a variety of observed market mechanisms, and then generates a number of testable hypotheses.

Madrian, Brigitte and Dennis Shea. "Preaching to the Converted and Converting Those Taught: Financial Education in the Workplace." University of Chicago Working Paper 2001. (no longer available)

Mahoney, Paul. "The Development of Securities Law in the United States," *Journal of Accounting Research*, Vol. 47, No. 2, May 2009.

Abstract: Given the existence of contract, property, fraud, and company law, what is the purpose of securities laws? Broadly speaking, they can serve either of two functions, or some mix of both. The first is to facilitate contracting among entrepreneurs, managers, shareholders, and financial intermediaries by providing a standardized set of rights and obligations (La Porta et al. 2005). Such laws are motivated by the desire to reduce transaction costs where contracting parties are widely dispersed and both writing complete contracts ex ante and renegotiating ex post are difficult. A second possible function is to restrict contracting by limiting the set of legally available terms. Such laws reflect the view that securities markets are beset by market failures stemming from externalities or investor irrationality (Coffee 1984; Fox 1999; Langevoort 2002). For the sake of simplicity, we can call the first a "contracting" paradigm and the second a "regulatory" paradigm.

Malcolm, Kyla, Tim Wilsdon and Charles Xie. "Cost of Providing Financial Advice" "Association of British Insurers Report from Charles River Associates." *ABI Research Paper No. 22*, 2010.

Charles River Associates (CRA) was commissioned by the ABI to conduct research into the cost of providing financial advice. The aim of the research is to identify the key components of a "full advice" service and to quantify the time and costs associated with each individual component.

Malmendier, Ulrike and Devin Shantikumar. “Are Small Investors Naïve about Incentives” *Journal of Financial Economics* 2007.

Abstract: Security analysts tend to bias stock recommendations upward, particularly if they are affiliated with the underwriter. We analyze how investors account for such distortions. Using the NYSE Trades and Quotations database, we find that large traders adjust their trading response downward. That is, they exert positive abnormal trade reaction to strong buy recommendations, but no reaction to buy and selling pressure for hold recommendations. Small traders, instead, follow recommendations literally. They exert positive pressure for both buy and strong buy recommendations and zero pressure for hold recommendations. Moreover, in the subsample of initiations, large traders discount recommendations more when the analyst is affiliated. We present suggestive evidence on the returns of these strategies and discuss possible explanations for the differences in trading response, including informational costs and investor naiveté.

Massa, Massimo. “How do Family Strategies Affect Fund Performance? When Performance-Maximization Is Not the Only Game in Town.” *Journal of Financial Economics*, 2003.

Abstract: This is a first attempt to study how the structure of the industry affects mutual fund behavior. I show that industry structure matters; the mutual fund families employ strategies that rely on the heterogeneity of the investors in terms of investment horizon by offering the possibility to switch across different funds belonging to the same family at no cost. I argue that this option acts as an externality for all the funds belonging to the same family, affecting the target level of performance the family wants to reach and the number of funds it wants to set up. By using the universe of the U.S. mutual fund industry, I empirically confirm this intuition. I find evidence of family driven heterogeneity among funds and show that families actively exploit it. I argue that the more families are able to differentiate themselves in terms of nonperformance-related characteristics, the less they need to compete in terms of performance. Product differentiation—i.e., the dispersion in the “services” (fees, performance) that the competing funds offer—affects performance and fund proliferation. In particular, I show that the degree of product differentiation negatively affects performance and positively affects fund proliferation.

Massa, Massimo, Pedro Matos and Jose Miguel Gaspar. “Favoritism in Mutual Fund Families? Evidence on Strategic Cross-Fund Subsidization” *Journal of Finance*. 2004.

Abstract: We investigate whether mutual fund families strategically transfer performance across member funds to favor those more likely to increase overall family profits. We find that “high family value” funds (i.e., high fees or high past performers) overperform at the expense of “low value” funds. Such a performance gap is above the one existing between similar funds not affiliated with the same family. Better allocations of underpriced IPO deals and opposite trades across member funds partly explain why high value funds overperform. Our findings highlight how the family organization prevalent in the mutual fund industry generates distortions in delegated asset management.

Massa, Massimo and Rajdeep Patgiri. “Incentives and Mutual Fund Performance: Higher Performance or Just Higher Risk Taking?” *The Review of Financial Studies* Volume 22, no. 5, 2009.

Abstract: We study the impact of contractual incentives on the performance of mutual funds. We find that high-incentive contracts induce managers to take more risk and reduce the funds’ probability of survival. Yet, funds with high-incentive contracts deliver higher risk-adjusted return, and the superior performance remains persistent. The top incentive quintile of funds outperforms the bottom quintile by 2.70% per year. Moreover, high-incentive winner funds from one year have a positive alpha of 0.41% per month in the following year. Focusing on funds’ holdings, we show that active portfolio rebalancing is the main channel through which incentives increase performance.

McBride, Kathleen. “8 Surprising Findings in the fi360-Advisorone Fiduciary Survey” January 19, 2011. Available at <http://www.advisorone.com/2011/01/19/8-surprising-findings-in-the-fi360advisorone-fiduc> Author cites survey that a large majority of brokers and advisors believe that disclosure is inadequate.

McKinsey & Company, “Restoring Americans Retirement Security: A Shared Responsibility”, 2009.

Conclusion: We are at a turning point for American retirement security. The recent financial crisis has brought to the forefront of public debate and consumers’ minds the lack of retirement preparedness among American households. Although the road will be challenging, government, plan sponsors and financial

institutions can help to dramatically improve the situation by collectively working to: (1) provide universal access to retirement plans, (2) ensure sufficient contribution and participation rates through auto-enrollment, adequate default rates and tailored incentives to stimulate voluntary contributions, (3) help Americans manage in-retirement risks, and (4) enable Americans to work longer by removing disincentives. Lastly, government and the private sector must launch a massive education effort to ensure that all Americans understand the need to begin saving early and sufficiently for retirement, as well as to help them navigate complex products to address the risks they face.

Mehran, Hamid and Rene Stulz. "The Economics of Conflicts of Interest in Financial Institutions", *Journal of Financial Economics*, Vol. 85, 2007.

Abstract: A conflict of interest exists when a party to a transaction can gain by taking actions that are detrimental to its counterparty. This paper examines the growing empirical literature on the economics of conflicts of interest in financial institutions. Economic analysis shows that, although conflicts of interest are omnipresent when contracting is costly and parties are imperfectly informed, there are important factors that mitigate their impact and, strikingly, it is possible for customers of financial institutions to benefit from the existence of such conflicts. The empirical literature reaches conclusions that differ across types of conflicts of interest but are overall more ambivalent and certainly more benign than the conclusions drawn by journalists and politicians from mostly anecdotal evidence.

Michaely, Roni and Kent Womack. "Conflict of Interest and the Credibility of Underwriter Analyst Recommendations." *Review of Economic Studies*. 1999.

Abstract: Brokerage analysts frequently comment on and sometimes recommend companies that their firms have recently taken public. We show that stocks that underwriter analysts recommend perform more poorly than "buy" recommendations by unaffiliated brokers prior to, at the time of, and subsequent to the recommendation date. We conclude that the recommendations by underwriter analysts show significant evidence of bias. We show also that the market does not recognize the full extent of this bias. The results suggest a potential conflict of interest inherent in the different functions that investment bankers perform.

Mitchell, Olivia and Kent Smetters. *The Pension Challenge: Risk Transfers and Retirement Income Security*. Oxford University Press. 2003.

Summary from PRC site: This book shows how pension systems can help protect against risks in light of current uncertain economic and financial global stresses. Several challenges confronting employees, retirees, companies, and governments are explored. Experts analyze whether and how financial products and systems can be better designed to meet and manage retirement risks.

Moore, Don, Lloyd Tanlu, and Max Bazerman. "Conflict of Interest and the Intrusion of Bias", *Judgement and Decision Making*, Vol. 5, No. 1, February 2010.

Abstract: This paper explores the psychology of conflict of interest by investigating how conflicting interests affect both public statements and private judgments. The results suggest that judgments are easily influenced by affiliation with interested partisans, and that this influence extends to judgments made with clear incentives for objectivity. The consistency we observe between public and private judgments indicates that participants believed their biased assessments. Our results suggest that the psychology of conflict of interest is at odds with the way economists and policy makers routinely think about the problem. We conclude by exploring implications of this finding for professional conduct and public policy.

Morey, Matthew. "Should You Carry the Load? A Comprehensive Analysis of Load and No-Load Mutual Fund Out-of-Sample Performance" *Journal of Banking & Finance* 27, 2003.

Abstract: This paper compares the out-of-sample performance of no-load and load mutual funds. Unlike previous studies, this paper provides a more comprehensive analysis as it uses methodologies to incorporate loads directly into the returns. We find two important results. First, after adjusting for loads in the returns data, no-load funds are found to perform much better than load funds, with the differences found to be significant at the 1% level across many different performance metrics. Second, we find that within load funds themselves there is little significant difference in out-of-sample performance between high-load funds and low-load funds even after adjusting for loads.

Mulliniathan, Sendhil, Markus Noth and Antoinette Schoar. "The Market for Financial Advice: An Audit Study"

A growing literature shows that households are prone to behavioral biases in choosing portfolios. Yet a large market for advice exists which can potentially insulate households from these biases. Advisers may efficiently mitigate these biases, especially given the competition between them. But advisers' self interest – and individuals' insufficiently correcting for it – may also lead to them giving faulty advice. We use an audit study methodology with four treatments to document the quality of the advice in the retail market. The results suggest that the advice market, if anything, likely exaggerates existing biases. Advisers encourage chasing returns, push for actively managed funds, and even actively push them on auditors who begin with a well-diversified low fee portfolio.

Munnell, Alicia, Mauricio Soto, Jerilyn Libby and John Prinzivalli. "Investment Returns: Defined Benefit vs. 401(k) Plans." Center for Retirement Research at Boston College. September, 2006 Number 52.

Conclusion: Three main conclusions emerge from this review. First, defined benefit plans outperformed 401(k) plans over the period 1988-2004. This conclusion is most evident using the weighted median. A higher equity allocation most likely led to higher 401(k) returns during the 1990s, while fees inevitably reduced returns. These two effects may well have balanced each other out, leaving a one percentage point shortfall due to poor timing and other investment mistakes.

Nanda, Vikram, M.P. Narayanan and Vincent Warther. "Liquidity, Investment Ability, and Mutual Fund Structure," *Journal of Financial Economics*, Vol. 57, 2000.

Abstract: We develop a model of the mutual fund industry in which the management fees and loads charged by actively managed open-end funds and average fund returns are determined endogenously in a competitive market setting. It is shown that heterogeneity in managerial skills at investing and minimizing costs, and the existence of investor clienteles with differing liquidity and marketing needs, gives rise to a variety of open-end fund structures that differ in the average return delivered to investors. Managers choose a fund's structure to maximize the rents they capture from their ability, taking into account the effect on investor flows. In equilibrium, funds that constrain liquidity withdrawals may have to charge lower fees and share some profits in the form of higher investor returns, when there is relative scarcity of investors with low liquidity needs.

Newton, Michael. "Fiduciary Duties of Broker-Dealers" April, 2011. Available at SSRN: <http://ssrn.com/abstract=1822670>

Abstract: The Dodd-Frank Act of 2010 called for the SEC to determine whether broker-dealers should have the same fiduciary duties as investment advisers. This paper examines whether broker-dealers should be held to this same standard, and provides a possible solution for addressing Congress' concerns.

Oliver Wyman. "Standard of Care Harmonization: Impact Assessment for SEC" attachment to SIFMA comment to DOL. October 2010.

Summary: Oliver Wyman collected data from a broad selection of retail brokerage firms to assess the impact of significant changes to the existing standard of care for broker-dealers and investment advisers. A total of 17 firms provided data; These institutions serve 38.2MM households and manage \$6.8TN in client assets; The survey captures approximately 33% of households and 25% of retail financial assets in the US; The primary issue at stake in the SEC 'standard of care' study is how to better protect the investor while preserving choice of relationship, product access, and affordability of advisory services. The key insight from the survey is that broker-dealers play a critical role in the financial services industry that cannot be easily replicated with alternative services models. Wholesale adoption of the Investment Advisers Act of 1940 for all brokerage activity is likely to have a negative impact on consumers (particularly smaller investors) across each of the following dimensions—choice, product access and affordability of advisory services

Oliver Wyman. "Assessment of the Impact of the Department of Labor's Proposed 'Fiduciary' Definition Rule on IRA Consumers", April 12, 2011. Available at: [http://www.fsround.org/fsr/dodd\\_frank/pdfs/fiduciary-duty/20110412-OliverWymanIRASStudyReport.pdf](http://www.fsround.org/fsr/dodd_frank/pdfs/fiduciary-duty/20110412-OliverWymanIRASStudyReport.pdf)

Conclusion: The Department of Labor's proposed rule change is motivated by a laudable objective: to ensure a high standard of care for retirement plan participants and account holders with

regard to the receipt of services and investment guidance, amid an increasingly complex financial marketplace. However, we find that the proposed Department of Labor “fiduciary” definition rule is likely to have serious negative and unintended effects on the very individuals the change is supposed to help. Based on the unprecedented collection of data on IRA account holders assembled to support our analysis, we conclude that the proposed rule will disproportionately negatively affect small balance IRA investors – those individuals most in need of support in reaching their retirement goals. The proposed rule is likely to change an important avenue through which retail investors save for retirement, denying millions of current and future IRA investors access to professional investment help and investment services, limiting choice of how they receive and pay for investment services, and increasing overall costs for such support when available.

O’Neal, Edward. “Mutual Fund Share Classes and Broker Incentives” *Financial Analysts Journal*, Vol. 55, No. 5, Sep.-Oct., 1999.

Abstract: U.S. SEC Rule 18f-3 allows mutual funds to offer multiple share classes that represent claims on the same underlying assets. Share classes differ with respect to distribution arrangements, which are modified by varying the timing and magnitude of load charges and annual distribution fees. For investors, the choice of share classes depends primarily on the expected holding period. Rule 18f-3 has also given rise to broker compensation arrangements that differ among share classes and, consequently, create for brokers as take in the class of shares clients purchase. In most circumstances and for most share class structures, brokers have monetary incentives to sell the class of shares that is least advantageous to investors. This conflict of interest is especially troubling because of the probable lack of financial sophistication of investors who pay for investment advice about mutual funds. The adverse incentives are potentially damaging to the mutual fund industry and should provoke a consideration of multiple share classes and the accompanying broker compensation arrangements.

Palaveev, Philip. “Be Careful What You Wish For”, *Financial Planning*, June 2008.

Palazzo, Guido. “Conflicts of Interest in Financial Intermediation”, *Journal of Business Ethics*, Vol 81, 2008

Abstract: The last years have seen a surge of scandals in financial intermediation. This article argues that the agency structure inherent to most forms of financial intermediation gives rise to conflicts of interest. Though this does not excuse scandalous behavior it points out market imperfections. There are four types of conflicts of interest: personal-individual, personal-organizational, impersonal-individual, and finally, impersonal-organizational conflicts. Analyzing recent scandals we find that all four types of conflicts of interest prevail in financial intermediation.

Patron, Hilde and Kenneth Roskelley, “The Effect of Reputation and Competition on the Advice of Real Estate Agents”, *Journal of Real Estate Financial Economics*

Abstract: We study a two-period bargaining game where buyers and sellers employ real estate agents to help them determine the sales price of a house. We find that agents are less likely to provide aggressive bargaining advice to their client when they receive percentage commissions and when they work for the buyer. In addition, we find that agents are less likely to suggest aggressive bargaining strategies when there is little market competition, the gains to trade are large, in markets where housing values appreciate slowly, and when dual agency is permitted. More importantly, we show that an agent is more likely to bargain aggressively and capture a portion of the gains to trade for a client when the house’s sales price is closely related to the agent’s reputation and future business (referrals).

Perun, Pamela. *EBRI Notes* May 2008, Vol. 29

This article uses the most recent SIPP data from the U.S. Census Bureau to examine the prevalence of IRAs and 401(k)-type plans among workers ages 21–64.

Pessin, Jaime. “Be Skeptical of the Hard Sell, Even if It’s in the Workplace,” *The Wall Street Journal*, Feb. 4, 2008.

Peterson, Jonathan. “Nest Egg to goose egg in no time” *Los Angeles Times*, Dec. 17, 2006.

This article cites examples where individuals are pushed to invest in high expense variable annuity products and retire prematurely.

Prentice, Robert. "Ethical Decision Making: More Needed than Good Intentions," *Financial Analysts Journal*, Vol. 63, No. 6. Nov./Dec. 2007.

[Reid, Brian and John Rea. "Mutual Fund Distribution Channels and Distribution Costs" \*Investment Company Institute Perspective\*. July 2003.](#)

Conclusion: The changes in the distribution of mutual funds during the past two decades have allowed investors to choose from a wider range of services and has provided greater access to mutual funds than was available in 1980. Companies sponsoring mutual funds are able to tailor funds and share classes to provide packages of services and means of paying for those services that better meet investor needs. The wider availability of mutual funds through new distribution channels, investors' increased reliance on no-load mutual fund share classes, and competition between load and no-load fund sponsors has sharply reduced the distribution costs paid by mutual fund shareholders.

[Robertson, Christopher. "Biased Advice," \*Arizona Legal Studies Discussion Paper, No 11-07, Feb 2011\*.](#)

Abstract: The modern capitalist society, characterized by decentralized decision making and increasingly sophisticated products and services, turns on relationships of epistemic reliance, where laypersons depend upon advisors to guide their most important decisions. Yet many of those advisors lack real expertise and may be biased by conflicting interests. In such situations, laypersons are likely to make suboptimal decisions that sometimes aggregate into systematic failures, from soaring health care costs to market crashes. Regulators can attempt to manage the symptoms and worst abuses, but the fundamental problem of biased advice will remain. There are many potential policy solutions, from outright bans on conflicting interests to disclosure mandates, yet their comparative effectiveness is poorly understood. By constructing a decision task for human subjects and providing advice in various scenarios, this Article reports new field experiments testing alternative policy mechanisms. Prior research has shown that disclosure mandates can be deleterious if they make advisors more biased, but this paper contextualizes those findings. It turns out that disclosures may be valuable in settings where relative expertise is low, but deleterious where relative expertise is high. By also disaggregating the data, one finds that disclosures of conflicting interests may hurt laypersons in the majority of situations where the conflicted advice is not actually biased. Thus, the evidence suggests that, if they are to be at all effective, disclosure mandates should be narrowly tailored. Most importantly, the evidence shows that a disclosure mandate improves layperson performance when unbiased advisors are also available. Yet laypersons appear to be poor judges of their need for unbiased advice, so market mechanisms may be ineffective for provisioning unbiased advice. In the end, the presence of an unbiased advisor is the strongest determinant of layperson performance, and thus policymakers must develop ways of aligning the interests of advisors and laypersons. Pay-for-performance, blinding of experts, and mandatory or subsidized second-opinion policies are likely to be helpful in aligning these interests.

Rogerson, William. *The Bell Journal of Economics*, Vol. 14 1983.

[Sah, Sunita, George Loewenstein, and Daylian Cain. "The Burden of Disclosure" 2010.](#)

Abstract: Although disclosure is often advanced as a potential solution to conflicts of interest, research on disclosure has found both positive and negative effects. We present five experiments that reveal a previously unrecognized perverse effect of disclosure: Disclosure of an advisor's conflict of interest can decrease advisees' trust in the advice while simultaneously increasing pressure to comply with that advice. This compliance pressure comes from two mechanisms: (1) recipients fear signaling distrust of the advisor, and (2) recipients feel an increased pressure to help their advisor when the advisor's personal interests have been disclosed. Hence, disclosure can place a burden on those it was supposed to protect. We also show that the increased pressure to comply effect is reduced if the disclosure is provided by an external source rather than directly from the advisor, is not common knowledge between the advisor and advisee, and if cooling off periods are introduced or the advisee can make a decision in private.

Sah, Sunita, Moore, Don A. and MacCoun, Robert, "Cheap Talk and Credibility: The Consequences of Confidence and Accuracy on Advisor Credibility and Persuasiveness", June 2011. Available at SSRN: <http://ssrn.com/abstract=1861475>

Abstract: Is it possible to increase one's influence simply by behaving more confidently? Prior research presents two competing hypotheses: (1) the confidence heuristic holds that more confidence increases credibility and (2) the calibration hypothesis asserts that overconfidence will backfire when others find out. Study 1 reveals, consistent with the calibration hypothesis, that while accurate advisors benefit from displaying confidence, confident but inaccurate advisors received the lowest ratings of credibility. Furthermore, when an advisor's inaccuracy is revealed, it is difficult for these advisors to recover from their lost credibility. But Study 2 shows that when feedback on advisor accuracy is unavailable or costly, confident advisors hold sway regardless of accuracy. In other words, the confidence heuristic prevails when accuracy is difficult to determine. However, people also made less effort to determine the accuracy of confident advisors; interest in buying advisor performance data decreased as the advisor's confidence went up.

Santacruz, Lujer and Peter Phillips. "Optimality of Financial Planning Clients' Strategic Asset Allocations," Presented at 20<sup>th</sup> Annual Finance and Banking Conference, 2007, Available at SSRN: [http://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=1009436](http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1009436)

Abstract: In this paper, the optimality of Australian financial planning clients' asset allocations are analysed using the mean-variance formulation of the Modern Portfolio Theory. The asset allocations recommended by financial planning groups are examined. The mean-variance characteristics of the various asset classes are derived from historical indices, using last 21 years data and last 5 years data. The return-risk values of the recommended portfolios are determined and a simple method of iso-risk maximum return calculation using the Excel Solver command is utilised to determine the corresponding optimal portfolios. The recommended portfolios were found to have expected returns that are around 8% and 32% below optimal returns based on last 21 years data and last 5 years data, respectively.

Eugene Scalia comment Letter to DOL, <http://www.dol.gov/ebsa/pdf/1210-AB32-PH063.pdf>

Schneider, Henry. "Agency Problems and Reputation in Expert Services: Evidence from Auto Repair" Johnson School Research Paper Series, No. 15-07. 2009. Available at SSRN: <http://ssrn.com/abstract=1022204>

Abstract: The efficient functioning of expert service markets is threatened by asymmetric information between experts and buyers about which services are needed and actually provided. Reputation has been identified as a possible market solution. The current study provides field evidence from undercover visits to garages to characterize the nature of agency problems in auto repair and to test whether reputation reduces these problems. I find that overtreatment and undertreatment are pervasive and find no evidence that reputation limits these problems.

Securities and Exchange Commission, Office of Compliance Inspections and Examinations. "Protecting Senior Investors: Report of Examinations of Securities Firms Providing 'Free Lunch' Sales Seminars," September 2007.

Conclusion: The results of these examinations lead regulators to conclude that financial services firms should take steps to supervise sales seminars more closely, and specifically take steps to review and approve all advertisements and sales materials for accuracy and to ensure that they do not contain exaggerated or misleading claims. In addition, firms should redouble efforts to ensure that the investment recommendations they make to seniors are suitable in light of the particular customer's investment objectives. With the growing senior demographic, firms might consider specific training for their registered representatives and investment advisers regarding sales to senior investors.

Shields, Timothy W. and Sheremeta, Roman M., Do Investors Trust or Simply Gamble? (January 14, 2011). Available at SSRN: <http://ssrn.com/abstract=1754168>

Abstract: We design an experiment to study individual behavior in a strategic information setting where the sender has economic incentives to deceive and the receiver has economic incentives to avoid deception. To ascertain whether subjects in the role of receiver glean information content from the sender's message, we elicit choices from risky gambles constructed to be mathematically equivalent to the information setting if

the sender's message lacks information content. In the experiment subjects act simultaneously as a sender and receiver in a one-shot interaction. The findings of our experiment indicate that (i) subjects tend to act deceptively as senders but trusting as receivers, (ii) as receivers, subjects glean excessive information content from the senders' messages, and (iii) risk preferences are consistent across tasks. Thus, we find investors (receivers) trust.

Siedle, Edward. "Secrets of the 401K Industry"

<http://www.benchmarkalert.com/Secrets%20of%20the%20401k%20Industry.pdf>

Spindler, James C., Conflict or Credibility: Analyst Conflicts of Interest and the Market for Underwriting Business. *Journal of Legal Studies*, Vol. 35, June 2006; USC CLEO Research Paper No. C06-3; USC Law Legal Studies Paper No. 06-6; U Chicago Law & Economics, Olin Working Paper No. 215. Available at SSRN: <http://ssrn.com/abstract=895550> or [doi:10.2139/ssrn.564381](https://doi.org/10.2139/ssrn.564381)

This paper argues that, contrary to conventional wisdom, conflicts of interest among equities research analysts (i.e., where investment banks would offer positive analyst research in quid pro quos for underwriting business) were beneficial to the capital markets. First, conflicted analyst research credibly signaled positive inside information that is otherwise too costly to communicate under Securities Act liability, correcting informational asymmetries. Second, conflicted analyst research mitigated agency costs between issuer and underwriter by allowing the underwriter to credibly commit to exerting more effort than the underwriter would prefer. Third, analyst research quid pro quos took the form of a competitive bidding market among underwriters, and may have improved competition in the underwriting industry. In light of these conclusions, recent reforms prohibiting analyst conflicts of interest are counterproductive. Preferable modes of regulation include liberalizing Securities Act liability, increasing mandatory disclosure of conflicts, and increasing fraud penalties.

Stoughton, Neal, Youchang Wu and Josef Zechner. "Intermediated Investment Management" *The Journal of Finance*. Forthcoming. Earlier version available at SSRN: <http://ssrn.com/abstract=966255>.

Abstract: Intermediaries such as financial advisers serve as an interface portfolio managers and investors. A large fraction of their compensation is often provided through kickbacks from the portfolio manager. We provide an explanation for the widespread use of intermediaries and kickbacks. Depending on the degree of investor sophistication, kickbacks are used either for the price discrimination or aggressive marketing. We explore the effects of these arrangements of fund size, flows, performance and investor welfare. Kickbacks allow higher management fees to be charged, thereby lowering net returns. Competition among active portfolio managers reduces kickbacks and increases the independence of advisory services.

Varnavides, Gary. "The Flawed State of Broker-Dealer Regulation and the Case for an Authentic Federal Fiduciary Standard for Broker-Dealers", *Fordham Journal of Corporate and Financial Law*. Vol. XVI, 2011.

Introduction: This Note addresses a critical section of the IPA: its proposal that broker-dealers be held to a new, higher standard of conduct towards customers modeled on the Investment Advisers Act of 1940 (the "'40 Act"). Currently, broker-dealers are regulated under the Securities Exchange Act of 1934 (the "'34 Act") and sometimes held to a fiduciary standard of conduct towards customers, whereas investment advisers are regulated under the "40 Act and always held to a fiduciary standard. This bifurcated regulatory scheme - the product of another era when broker-dealers and investment advisers were distinct entities - results in two different regulatory standards and enforcement.

Vincent, Scott, Is Portfolio Theory Harming Your Portfolio? (April 29, 2011). Available at SSRN: <http://ssrn.com/abstract=1840734>

Abstract: Modern Portfolio Theory (MPT) teaches us that active equity managers who use judgment to make investment decisions won't be able to match the returns (after fees and expenses) of blindly-invested, passively-managed index funds. Data on returns supports the theory, so it's no surprise that investors are leaving actively managed funds in droves for the better average returns of super-diversified index strategies. Yet the reality is much murkier than we've been led to believe. It turns out that the portfolio theories which inspired the creation and popularity of index funds and top-down, quantitatively-driven index-like strategies, are both flawed and impractical. There's compelling evidence, moreover, that a subset of active managers do persistently outperform indexes. However, this important fact has been lost because we allow MPT to define the debate in its own misleading terms, tilting the field in its favor and hiding the reality about active manager performance in a complex game of circular arguments.

Weinberg, Neil and Daniel Kruger. "Death by a Thousand Trades", *Forbes*, 12/11/2000  
[http://www.forbes.com/forbes/2000/1211/6615262a\\_2.html](http://www.forbes.com/forbes/2000/1211/6615262a_2.html)

Excerpt: Payment for order flow is, alas, but one of several ways Wall Street profits from the unwary. In a practice known as "internalization," a broker executes your trade entirely in-house rather than sending it out onto the open market where it might attract better prices. This lets him pocket the spread between the lower price a seller is willing to accept and the higher price you are willing to pay.

Weiss, Gary "Wall Street Versus America"

Excerpt from New York Times review: This anecdote serves to introduce the book's larger premise: that Wall Street's rules have been made to protect Wall Street from you, not the other way around. That those who preside over institutions like the [New York Stock Exchange](#) and the Securities and Exchange Commission have perfected the art of sounding indignant but doing nothing. (Mr. Weiss amends "Take On the Street," the title of a book by the former S.E.C. chairman [Arthur Levitt](#), to read: "Take On the Street — I Sure as Hell Didn't.") And that the ways in which Wall Street regulates itself are fundamentally corrupt. Mr. Weiss says that only a more vigilant public can fix what's broken.

Welch, Ivo. "Herding Among Security Analysts" *Journal of Financial Economics*, Vol. 58, No. 3, December 2000

The paper shows that the buy or sell recommendations of security analysts have a significant positive influence on the recommendations of the next two analysts. This influence can be traced to short-lived information in the most recent revisions. In contrast, the influence of the prevailing consensus is not stronger if the consensus accurately forecasts subsequent stock price movements. This indicates consensus herding consistent with models in which analysts herd based on little information. The consensus also has a stronger influence when market conditions are favorable. The resulting poorer information aggregation could cause bull markets to be intrinsically more "fragile" (e.g., Bikhchandani et al., *J. Political Economy* 100(5) (1992) 992-1026).

Wermers, Russ R., Is Money Really 'Smart'? New Evidence on the Relation Between Mutual Fund Flows, Manager Behavior, and Performance Persistence (May 2003). Available at SSRN:  
<http://ssrn.com/abstract=414420> or doi:10.2139/ssrn.414420

Abstract: Mutual fund returns strongly persist over multi-year periods - that is the central finding of this paper. Further, consumer and fund manager behavior both play a large role in explaining these long-term continuation patterns - consumers invest heavily in last-year's winning funds, and managers of these winners invest these inflows in momentum stocks to continue to outperform other funds for at least two years following the ranking year. By contrast, managers of losing funds appear reluctant to sell their losing stocks to finance the purchase of new momentum stocks, perhaps due to a disposition effect. Thus, momentum continues to separate winning from losing managers for a much longer period than indicated by prior studies.

Even more surprising is that persistence in winning fund returns is not entirely explained by momentum - we find strong evidence that flow-related buying, especially among growth-oriented funds, pushes up stock prices. Specifically, stocks that winning funds purchase in response to persistent flows have returns that beat their size, book-to-market, and momentum benchmarks by two to three percent per year over a four-year period. Cross-sectional regressions indicate that these abnormal returns are strongly related to fund inflows, but not to the past performance of the funds - thus, casting some doubt on prior findings of

persistent manager talent in picking stocks. Finally, at the style-adjusted net returns level, we find no persistence, consistent with the results of prior studies. On balance, we confirm that money is smart in chasing winning managers, but that a "copycat" strategy of mimicking winning fund stock trades to take advantage of flow-related returns appears to be the smartest strategy.

West, Richard. "Conflicts of Interest: Substance or Subterfuge?" *Financial Analysts Journal*, Vol. 27, No. 6, Nov.-Dec. 1971.

From Introduction: This is not to say, of course, that conflicts of interest cannot be a problem; rather, it is to say that they need not be so regarded in the types of settings described above. The basic point is that in these and similar settings, there exist sufficient actual and potential competitors to make conflict of interest problems highly unlikely. Accordingly, suggestions that various financial intermediaries should be prohibited from engaging in certain activities on conflict of interest grounds would seem to be ill-founded. Indeed, to the extent that these suggestions discourage the entrance of new competition into some lines of commerce, they imply economic consequences more onerous than those their sponsors presumably seek to prevent. The paper begins with a discussion of the conflict of interest problems related to combining brokerage and money management activities. It then reviews the conflict problems alleged to result from permitting commercial banks to underwrite revenue bonds. Finally, drawing on the analysis of these two cases, it concludes by considering under what circumstances it is truly in the public interest to prohibit a combination of various financial activities on conflict of interest grounds.

Woolf, Edward. "Pensions in the 2000s: The Lost Decade" *NBER Working Paper 16991*. April 2011.

Abstract: One of the most dramatic changes in the retirement income system over the last three decades has been a decline in traditional defined benefit (DB) pension plans and a corresponding rise in defined contribution (DC) pensions. Have workers benefited from this change? Using data from the Survey of Consumer Finances, I find that after robust gains in the 1980s and 1990s, pension wealth experienced a marked slowdown in growth from 2001 to 2007. Projections to 2009 indicate no increase in pension wealth from 2001 to 2009. Retirement wealth is also found to offset the inequality in standard household net worth. However, I find that pensions had a weaker offsetting effect on wealth inequality in 2007 than in 1989. As a result, whereas standard net worth inequality showed little change from 1989 to 2007, the inequality of private augmented wealth (the sum of pension wealth and net worth) did increase over this period. These results hold up even when Social Security wealth and employer contributions to DC plans are included in the measure of wealth and when adjustments are made for future tax liabilities on retirement wealth.

Yoong, Joanne and Angela Hung, "Self-Dealing and Compensation for Financial Advisor" *RAND Working Paper*, Sept. 2009.

Abstract: Recent legislative and regulatory activity related to investment advice in 401(k) plans has focused on the issue of self-dealing. In this paper, the authors develop a framework that addresses questions of self-dealing based on the direct-marketing model introduced by Inderst and Ottaviani (2009). They specifically adapt the model to the setting of 401(k) plan advice, extend the theoretical framework to consider the implications of financial literacy and discuss various key aspects of existing and proposed 401(k) advice legislation in the context of the model's predictions.

Zhao, Xinge. "The Role of Brokers and Financial Advisors Behind Investments into Load Funds," December 2005. Available at: <http://www.ceibs.edu/knowledge/papers/images/20060317/2845.pdf>

Abstract: This paper finds that load funds with higher loads tend to receive higher flows, showing evidence that there exists conflict of interests between load fund investors and brokers and financial advisors: brokers and financial advisors apparently serve their own interests by guiding investors into funds with higher loads, which generate higher income to the brokers and financial advisors but increase the expenses of investors. As a result, fund families have been steadily increasing fund loads since the mid 1990s. However, when their interests are not compromised, brokers and financial advisors might exhibit similar behaviors as no-load fund investors in chasing past performance and investing in fund families with more options. Furthermore, they are more likely to direct load fund investors into smaller funds, which might experience better performance, while no-load fund investors flock into larger funds with more visibility.

Zitzewitz, Eric. "Retail Securities Regulation in the Aftermath of the Bubble" *Economic Regulation and Its Reform: What Have We Learned?* Ed. Nancy Rose, NBER, 2007.

Abstract: This paper discusses recent issues in the regulation of the retail securities and investments industry, written for and from the perspective of an industrial organization economist. It reviews the sources of market failure that create an economic rationale for regulation and provides a brief overview of the laws and institutions that comprise modern securities regulation. It then turns to three recent issues with parallels in other industries: the regulation of pricing, antitrust policy, and the regulatory implications of firm boundaries.

**Subject:** Discussion with SEC and CFTC staff regarding Title VII major participant definitions  
**Date:** Tuesday, October 18, 2011 4:36:16 PM

---

Tim,

Thank you for speaking with me earlier today. As we discussed, SEC and CFTC staff would like to have the chance to speak with DOL staff regarding the ERISA exclusion found in the definitions of “major swap participant” and “major security-based swap participant” set forth by Title VII of the Dodd-Frank Act. Relevant background information is below.

Regards,

Josh Kans  

Statutory provisions – Under both the CEA and Exchange Act, one prong of the major participant definition captures entities that maintain a “substantial position” in swaps or security-based swaps, with an exclusion for:

positions maintained by any employee benefit plan (or any contract held by such a plan) as defined in paragraphs (3) and (32) of section 3 of the Employee Retirement Income Security Act of 1974 (29 U.S.C. 1002) for the primary purpose of hedging or mitigating any risk directly associated with the operation of the plan;

December proposing release – The joint CFTC/SEC proposing release from December 2010 is at the following link: <http://www.sec.gov/rules/proposed/2010/34-63452fr.pdf>. The ERISA exclusion is addressed on page 80201.

Comment letters – The following commenters addressed the ERISA exclusion (as well as the general application of the definitions to pension plans):

BlackRock (pages 9-10) <http://www.sec.gov/comments/s7-39-10/s73910-63.pdf>

ERISA Industry Committee <http://www.sec.gov/comments/s7-39-10/s73910-44.pdf>

**Subject:** ABA Response to DOL Information Request

Joe –

Thanks for your letter of February 10, 2012, requesting a broad range of amount of data (up to 10 years) that is intended to assist the Department of Labor to evaluate the impact, if any, of conflicts of interest faced by brokers or others who advise IRA investors. As we've stated in our January 24<sup>th</sup> meeting with you and other trade groups, such data is not maintained or collected by ABA. While our members want to be helpful to DOL, communications thus far received from them indicate that individual account data is not readily available in a format requested by DOL and that such collection (assuming this data is available at all) will likely require considerable and sustained commitments of time and human resources, both of which – due to the impact of Dodd-Frank, among other things – are in precious short supply. Some members are also not clear how the requested data, assuming it can be retrieved, analyzed, extracted, and meaningfully aggregated, will

reveal the conflicts of interest that the re-proposed fiduciary regulation is intended to address.

I think it would help our members if you can provide illustrations of how the requested data could be used to indicate a conflict of interest and how that can be usefully compared to situations involving no conflict (particularly in situations where documentation doesn't necessarily reflect customer conversations or subsequent investment performance), so that they can properly consider whether useful data may be readily available.

Thanks.

TIM

**To:** Hauser, Timothy - SOL  
**Subject:** FINRA's Customer Account Statements Proposal

Hi Tim.

I hope you are doing well. I was hoping that you and your colleagues could help us with a new issue.

We wanted to flag for you a comment letter that we received from TIAA-CREF regarding a

FINRA proposal concerning customer account statements. By way of background, in May 2009, we noticed FINRA's rule proposal governing customer account statements, under which statements would have been required to be delivered on a monthly basis, instead of the current quarterly requirement. In response to comments to that proposal, FINRA recently filed an amendment which carved out a number of specific circumstances from the monthly statement requirement.

The notice of the amendment is available at: <http://www.sec.gov/rules/sro/finra/2011/34-64969.pdf> <<http://www.sec.gov/rules/sro/finra/2011/34-64969.pdf>>

TIAA-CREF, in its comment letter, argues that transactions effected in employer-sponsored retirement plans should be generally excluded from the monthly requirement. It suggests that FINRA's attempt to exclude certain retirement plan transactions effectively provides no relief. SIFMA made similar arguments, and their letter is attached for reference.

We would be grateful for your thoughts on the concerns raised and potential implications. We believe FINRA would be more than happy to benefit from your expertise as well. We are obligated to act on the proposal by the end of October, and FINRA is anticipating providing a draft response to us in the next few weeks. If you are available, perhaps we could find a time to have a call with FINRA early next week?

Kind regards,

Lourdes

Kent A. Mason, Esq.  
Davis and Harman LLP  
The Willard  
1455 Pennsylvania Avenue  
Suite 1200  
Washington, DC 20004

December 16, 2011

Dear Mr. Mason:

As you are aware, on October 22, 2010, the Department of Labor's Employee Benefits Security Administration (EBSA) issued a proposed rule that would amend a 1975 regulation defining when a person providing investment advice becomes a fiduciary under section 3(21)(A)(ii) of the Employee Retirement Income Security Act of 1974 (ERISA). On September 19, 2011, EBSA announced its intention to re-propose the rule.

EBSA is now developing an expanded regulatory impact analysis (RIA) that will assess the impact of the re-proposal on both ERISA plans and Individual Retirement Accounts. The expanded RIA will take into account input from stakeholders and consultations with other federal agencies.

On April 12, 2011, you submitted to EBSA a study prepared by Oliver Wyman that assessed the impact of the proposed rule on IRA consumers. In order to help inform EBSA's expanded RIA, we request your voluntary assistance. In particular we ask that you provide the dataset(s) underlying the statistics and analysis presented (with identifying information removed as necessary). We also would like you to explain the following: (1) how the particular entities included in the dataset were selected; and (2) how their structures (for example, presence of affiliated product manufacturers), business models and practices, and product and service offerings compare with those of entities not included. We also would like you to provide answers to the questions presented in the attached document.

In order that we may use the information in drafting our re-proposal, a prompt response is needed. Please provide the information requested within 30 days of the date of this letter to:

## **Follow-up questions on Oliver Wyman Report dated April 12, 2011**

Page 10-11. See figures 6 and 7. Is this really a distribution of account holders by asset level, or is it a distribution of accounts? That is, if a single account holder has multiple accounts (with one or multiple vendors) are those accounts aggregated or counted separately here? (Presumably some account holders have additional accounts with vendors not included in the sample?)

Page 12. See figure 9, last line, number of trades per account. Can you provide additional information characterizing the account holdings and activity? For example, are most accounts holding a few positions consisting of internally diversified funds representing different asset classes? How many are holding individual securities? Is the activity mostly in the nature of periodic rebalancing? With respect to number of trades and turnover, are most accounts near the average, or is the distribution more bi-modal, with some accounts trading heavily and others little if any? Can you provide data on the size of these trades?

Do you have data linking some or all of the following: account positions and trades, advice interactions (including whether a trade was solicited), adviser (broker) compensation arrangements, investor fees (including loads/commissions and expense ratios) and performance? If so, can you perform additional analysis on such data, or make such data available for analysis by others?

Page 21-22, figure 15. The comparison pertains to "direct costs." Can you provide similar information for indirect costs? Including those referenced in figure 15 footnote 1? Why were these excluded from the comparison? What is the basis for the conclusion that if these costs were considered "brokerage would continue to be less expensive"? Do the brokerage figures reported here include both full service and discount brokerage?

"Firms vary in whether they receive such [indirect] fees and how they account for them." Can you quantify that variation? What is the incidence and amount of these types of compensation, both by source (such as product manufacturer) and recipient (such as the broker)? What explains the variation? What is being compensated?

Various pages. Can you separate statistics for discount v. full service brokerage?

Page 23 figure 16, and elsewhere. Did Wyman attempt to determine whether net returns differ depending on distribution channel and/or broker conflicts? Did Wyman review academic literature or other evidence on this question?

Washington, DC 20036

Dear Mr. Keehan:

As you are aware, on October 22, 2010, the Department of Labor's Employee Benefits Security Administration (EBSA) issued a proposed rule that would amend a 1975 regulation defining when a person providing investment advice becomes a fiduciary under section 3(21)(A)(ii) of the Employee Retirement Income Security Act of 1974 (ERISA) and 4975(e)(3) of the Internal Revenue Code. EBSA's goal in issuing the proposal was to ensure that potential conflicts of interest among investment advisers are not allowed to compromise the quality of investment advice that millions of American workers rely on to ensure their retirement income security.

On September 19, 2011, EBSA announced its intention to re-propose the rule. Consistent with the principals set forth in Executive Order 13563 issued by President Obama on January 11, 2011, the re-proposal will provide the public with additional opportunity to participate in the rulemaking process through an open exchange of information and perspectives.

EBSA is now developing an expanded regulatory impact analysis (RIA) that will assess the impact of the re-proposal on both ERISA plans and Individual Retirement Accounts. The expanded RIA will take into account input from stakeholders and consultations with other federal agencies.

The purpose of this letter is to solicit your organization's voluntary assistance in obtaining data that will help inform EBSA's expanded RIA. EBSA is particularly interested in data that will help to more rigorously and definitively determine what impact, if any, conflicts of interest faced by brokers or other who advise IRAs have on IRA investors. The attachment to this letter describes data that we believe would be helpful for this purpose.

In order that we may use the data in drafting our re-proposal, a prompt response would be most appreciated. Please provide such data within 30 days of the date of this letter to:

The Office of Policy and Research

Employee Benefits Security Administration  
Room N-5718  
U.S. Department of Labor  
200 Constitution Ave  
Washington, DC 20210  
Attention: Definition of Fiduciary RIA Data Request

If you prefer, you may submit the requested information by email to [REDACTED]@dol.gov. The subject line of electronic responses should contain the following: "Definition of Fiduciary RIA Data Request."

We expect that any information provided will be made part of the public record of this rulemaking. EBSA appreciates your assistance in this matter. If you have any questions regarding this data request or need additional information, please contact G. Christopher Cosby of the Office of Policy and Research at [REDACTED].

Sincerely,

Joseph S. Piacentini  
Director  
Office of Policy and Research

cc: Phyllis C. Borzi  
Michael L. Davis  
Alan D. Lebowitz

## **Attachment: Data to assess the impact of conflicts on IRAs**

### Data at the level of the individual account

1. To construct dependent variable(s) (primarily, investor/account net rate of return):
  - a. For each investment held and for the account overall, personal rate of return (dollar weighted and net of fees/loads), ideally for each of a large number of consecutive periods (such as 40 quarters, or ten years) ending with a very recent period (such as Dec. 31 2010 or June 30 2011). Alternatively, data points necessary to construct this, namely amounts and timing of dividend payments and realized gains (and indication whether these are immediately reinvested) along with share prices.
  - b. Identification, share class, time-weighted performance, investment strategy, measure of risk, and fee table of each fund/security.
  - c. Gross flows by security/fund transacted, date. Ideally, full content of each transaction notice. Price, commissions/loads. Mark-ups/downs in principal transactions, and the references against which the mark-up/downs were measured. Indication whether transaction was initiated by investor or advisor.
2. To construct independent variables of interest:
  - a. Type of account: IRA (traditional retail, or SEP/SIMPLE), taxable retail, DC/401(k)
  - b. Distribution channel (advisory, discount brokerage, full service brokerage, direct).
  - c. Identity of advisor. Attributes of adviser (if any). Broker dealer, RIA, other?
  - d. Compensation arrangements (both at registered representative and institution level). Ideally, including any separate/variable compensation attributable to each transaction and fund/security held.
  - e. Advice rendered, including specific recommendations and whether such recommendations were solicited. (Connect with 1c to construct whether advice was followed.)
  - f. Adviser service level and type. Is the adviser providing ERISA/IRC fiduciary advice (under existing 3(21) rule)?
3. Account-specific control variables:
  - a. Account holder demographic and economic attributes.
  - b. Account holder financial literacy measures.
  - c. Account holder risk appetite measures.
  - d. Account holder investment strategy preferences or instructions.
  - e. Length of time with financial firm.
  - f. Length of time with advisor.

### External/more aggregate level variables (must be matched to account level data):

1. To construct dependent variable(s):

- a. Information necessary for risk adjustment of returns from 1a (e.g., to express returns as “alpha”).
  - b. May be able to import from external source: 1b performance and fees and 2b.
2. To construct independent variables of interest:
    - a. Compensation arrangements of specific advisors with respect to specific products, including changes to such arrangements over time.
3. Controls:
    - a. Market/benchmark performance for various asset/fund classes.
    - b. General market conditions.

**Subject:** ABA Response to DOL Information Request

Joe –

Thanks for your letter of February 10, 2012, requesting a broad range of amount of data (up to 10 years) that is intended to assist the Department of Labor to evaluate the impact, if any, of conflicts of interest faced by brokers or others who advise IRA investors. As we've stated in our January 24<sup>th</sup> meeting with you and other trade groups, such data is not maintained or collected by ABA. While our members want to be helpful to DOL, communications thus far received from them indicate that individual account data is not readily available in a format requested by DOL and that such collection (assuming this data is available at all) will likely require considerable and sustained commitments of time and human resources, both of which – due to the impact of Dodd-Frank, among other things – are in precious short supply. Some members are also not clear how the requested data, assuming it can be retrieved, analyzed, extracted, and meaningfully aggregated, will reveal the conflicts of interest that the re-proposed fiduciary regulation is intended to address.

I think it would help our members if you can provide illustrations of how the requested data could be used to indicate a conflict of interest and how that can be usefully compared to situations involving no conflict (particularly in situations where documentation doesn't necessarily reflect customer conversations or subsequent investment performance), so that they can properly consider whether useful data may be readily available.

Thanks.

**Subject:** Discussion with SEC and CFTC staff regarding Title VII major participant definitions

Tim,

Thank you for speaking with me earlier today. As we discussed, SEC and CFTC staff would like to have the chance to speak with DOL staff regarding the ERISA exclusion found in the definitions of "major swap participant" and "major security-based swap participant" set forth by Title VII of the Dodd-Frank Act. Relevant background information is below.

Regards,

Josh Kans  
[REDACTED]

Statutory provisions – Under both the CEA and Exchange Act, one prong of the major participant definition captures entities that maintain a "substantial position" in swaps or security-based swaps, with an exclusion for:

positions maintained by any employee benefit plan (or any contract held by such a plan) as defined in paragraphs (3) and (32) of section 3 of the Employee Retirement Income Security Act of 1974 (29 U.S.C. 1002) for the primary purpose of hedging or mitigating any risk directly associated with the operation of the plan;

December proposing release – The joint CFTC/SEC proposing release from December 2010 is at the following link: <http://www.sec.gov/rules/proposed/2010/34-63452fr.pdf>. The ERISA exclusion is addressed on page 80201.

Comment letters – The following commenters addressed the ERISA exclusion (as well as the general application of the definitions to pension plans):

BlackRock (pages 9-10) <http://www.sec.gov/comments/s7-39-10/s73910-63.pdf>

ERISA Industry Committee <http://www.sec.gov/comments/s7-39-10/s73910-44.pdf>

**Subject:** Fiduciary Regulation

Hi, Jennifer

I just wanted to confirm that we would like to start discussions about our draft text for the ERISA fiduciary advice regulation. On our end, I would expect to draw participants from the EBSA offices responsible for regulations, exemptions, and economic analysis, as well as from my office. We'd be happy to meet here or come to the SEC. If you have a few good dates and times in the next few weeks and could gather a similar group of participants, I think the discussion could be very useful. Please let me know what works for you.

**Subject:** FINRA's Customer Account Statements Proposal

Hi Tim.

I hope you are doing well. I was hoping that you and your colleagues could help us with a new issue.

We wanted to flag for you a comment letter that we received from TIAA-CREF regarding a FINRA proposal concerning customer account statements. By way of background, in May 2009, we noticed FINRA's rule proposal governing customer account statements, under which statements would have been required to be delivered on a monthly basis, instead of the current quarterly requirement. In response to comments to that proposal, FINRA recently filed an amendment which carved out a number of specific circumstances from the monthly statement requirement.

The notice of the amendment is available at: <http://www.sec.gov/rules/sro/finra/2011/34-64969.pdf> <<http://www.sec.gov/rules/sro/finra/2011/34-64969.pdf>>

TIAA-CREF, in its comment letter, argues that transactions effected in employer-sponsored retirement plans should be generally excluded from the monthly requirement. It suggests that FINRA's attempt to exclude certain retirement plan transactions effectively provides no relief. SIFMA made similar arguments, and their letter is attached for reference.

We would be grateful for your thoughts on the concerns raised and potential implications. We

believe FINRA would be more than happy to benefit from your expertise as well. We are obligated to act on the proposal by the end of October, and FINRA is anticipating providing a draft response to us in the next few weeks. If you are available, perhaps we could find a time to have a call with FINRA early next week?

Kind regards,

Lourdes

**Subject:** FW: FINRA's Customer Account Statements Proposal

Hi Tim,

I'm working with Lourdes on FINRA's Customer Account Statements Proposal. We were wondering if you might be available to touch base with us and FINRA on Wednesday afternoon. I believe that we all have availability between 3-4pm. If that time does not work for you, please let me know if you have any time on Friday.

Many thanks,  
Alicia

**To:** Hauser, Timothy - SOL  
**Subject:** FINRA's Customer Account Statements Proposal

Hi Tim.

I hope you are doing well. I was hoping that you and your colleagues could help us with a new issue.

We wanted to flag for you a comment letter that we received from TIAA-CREF regarding a FINRA proposal concerning customer account statements. By way of background, in May 2009, we noticed FINRA's rule proposal governing customer account statements, under which statements would have been required to be delivered on a monthly basis, instead of the current quarterly requirement. In response to comments to that proposal, FINRA recently

filed an amendment which carved out a number of specific circumstances from the monthly statement requirement.

The notice of the amendment is available at: <http://www.sec.gov/rules/sro/finra/2011/34-64969.pdf> <<http://www.sec.gov/rules/sro/finra/2011/34-64969.pdf>>

TIAA-CREF, in its comment letter, argues that transactions effected in employer-sponsored retirement plans should be generally excluded from the monthly requirement. It suggests that FINRA's attempt to exclude certain retirement plan transactions effectively provides no relief. SIFMA made similar arguments, and their letter is attached for reference.

We would be grateful for your thoughts on the concerns raised and potential implications. We believe FINRA would be more than happy to benefit from your expertise as well. We are obligated to act on the proposal by the end of October, and FINRA is anticipating providing a draft response to us in the next few weeks. If you are available, perhaps we could find a time to have a call with FINRA early next week?

Kind regards,

Lourdes

**Subject:** FINRA's Customer Account Statements Proposal

Hi Tim.

I hope you are doing well. I was hoping that you and your colleagues could help us with a new issue.

We wanted to flag for you a comment letter that we received from TIAA-CREF regarding a FINRA proposal concerning customer account statements. By way of background, in May 2009, we noticed FINRA's rule proposal governing customer account statements, under which statements would have been required to be delivered on a monthly basis, instead of the current quarterly requirement. In response to comments to that proposal, FINRA recently filed an amendment which carved out a number of specific circumstances from the monthly statement requirement.

The notice of the amendment is available at: <http://www.sec.gov/rules/sro/finra/2011/34-64969.pdf> <<http://www.sec.gov/rules/sro/finra/2011/34-64969.pdf>>

TIAA-CREF, in its comment letter, argues that transactions effected in employer-sponsored retirement plans should be generally excluded from the monthly requirement. It suggests that FINRA's attempt to exclude certain retirement plan transactions effectively provides no relief. SIFMA made similar arguments, and their letter is attached for reference.

We would be grateful for your thoughts on the concerns raised and potential implications. We believe FINRA would be more than happy to benefit from your expertise as well. We are obligated to act on the proposal by the end of October, and FINRA is anticipating providing a draft response to us in the next few weeks. If you are available, perhaps we could find a time to have a call with FINRA early next week?

Kind regards,

Lourdes

March 1, 2012

Mr. Joseph S. Piacentini  
Director  
The Office of Policy and Research  
Employee Benefits Security Administration  
U.S. Department of Labor – Room [REDACTED]  
200 Constitution Ave., NW  
Washington, DC 20210

Dear Mr. Piacentini:

We are writing in response to your request for data related to the economic analysis the Department of Labor (the “Department”) is required to undertake in order to re-propose regulations that would substantially modify the definition of a fiduciary under section 3(21)(A)(ii) of the Employee Retirement Income Security Act of 1974 (“ERISA”).

In your original request for data, which we received in late December 2011<sup>1</sup>, you noted that the Department was trying to develop a more appropriate “expanded” regulatory impact analysis that would assess the impact of the re-proposal on both ERISA-covered plans and Individual Retirement Accounts (“IRAs”) subject to the prohibited transaction provisions of section 4975 of the Internal Revenue Code of 1986. You requested a significant amount of information that covered every client account, and every trade in every account, including investment returns in these accounts, over the last ten years. Further, you requested information about current and former ERISA plan and IRA account holders’ economic attributes, financial literacy, length of time with their broker or adviser and various other points of personal information about each account holder and his broker or adviser.

As we have explained to the Department in numerous discussions (including at a meeting on January 24 that was attended by our trades and several others that received the Department’s December data request), none of our trade associations maintains an electronic or hard-copy database containing the information the Department has requested. Nor have we ever undertaken the type of costly and extensive survey and system build that would be required to obtain and collate this vast amount of data. At the Department’s request, and in light of our sincere belief that an appropriately structured regulatory impact analysis will support our belief that the any regulatory revision to the definition of the term “fiduciary” consistent with the Department’s October 2010 proposal will be extremely costly to participants and service providers, with little tangible benefit, we have reached out to several hundred member companies to determine what, if any, data responsive to the Department’s request, might be available and in what format (electronic, searchable, PDF, paper, *etc.*). We address what our member companies are telling us concerning this request below.

In light of our conversations with our members we also would like to make the following points with respect to the data request itself.

---

<sup>1</sup> Letter sent to Timothy Ryan, President and CEO, SIFMA, dated December 15, 2011 and received December 22<sup>nd</sup>, 2011. Letters also sent to IRI and FSR.

## **The Department Does Not Seem to be Requesting Useful Data**

Our members are extremely concerned that the Department is neither looking for the “right” type of data to complete an appropriate regulatory impact analysis, nor do we believe that if it were to receive all of the data it has requested, it could analyze it in a manner that controls for outside variables. While the Department so far has declined our request that it share with us the methodology it plans to use to analyze the data it collects, we would like to make the following observations. First, if the Department would like to use the data to try to determine the relationship, based on individual investor experience, between (a) the “quality” of advice being provided, (b) the aggregate or investment-specific fees being charged, and (c) the account performance (or the performance of any particular asset), we believe the data requested will be of little use to the Department. The request does not differentiate between non-fiduciary advice and fiduciary advice, raising the question of accurate comparisons against a “control group” population. If the Department would like to use the data to compare fees and performance in non-fiduciary accounts and accounts where a financial representative agrees it is acting as a fiduciary, we also do not think the data requested will be helpful because it would not differentiate between the two groups, and does not control for whether, in a non-advised account on any particular transaction, a recommendation was or was not made, and if one was made, whether it was followed. It also does not take into account the situation where an investor has multiple account types, one or more of which may be used for more aggressive and riskier investing.

We also question how focusing on investor attributes (a key data component requested by the Department) correlates, if at all, with the existence of or quality of the investment advice rendered by the financial institutions being surveyed, either in a brokerage context or where the financial institution, or an affiliate, serves as a fiduciary to a client in a non-discretionary capacity. As we have stated many times, we believe that, in order to determine the true economic impact of a regulation like the one proposed by the Department in 2010, of turning virtually all conversations between brokers (and other service providers) into fiduciary “investment advice”, the Department needs to focus on the very real potential negative cost to plans and individual account holders if they do not have access to meaningful retirement planning.

Should the proposal move forward as proposed, individuals will no longer have access to asset allocation assistance or guidance regarding the benefits of raising their deferral rate. There will be limited retirement planning help, as well as the guidance necessary to educate about the tax consequences of taking a withdrawal, loan or hardship distribution. Even simple discussions regarding saving in the appropriate retirement plan or helping clients make pre-tax or post-tax distribution decisions will become cost prohibitive or obsolete. These are education efforts undertaken by many advisors which could turn them into fiduciaries under the Department’s proposal which will then limit the availability of these services. This will impact individual retirement savings and needs to be assessed by the Department to determine the cost of the proposal. Unfortunately we do not see any evidence in the request that the Department sent to us that the Department is even remotely considering these costs. Of course, if the Department already understands and concedes these costs, perhaps it has determined that no further data is necessary.

## **Challenges with providing the millions of pieces of data requested**

While we continue to encourage the Department to re-focus its efforts on the cost impact to individual investors, we are working to be responsive to the Department's request by trying to determine what data our members might be able to provide. Our member firms have collectively spent a tremendous amount of time over the past several weeks working with their technology, operations and business partners to determine what data from the Department's request is available and in what form, as well as the resource and cost impact in providing that data. Initial cost estimates from some of our member firms in providing even a portion of the data runs in the hundreds of thousands of dollars. As stated above, not only is this type of cost and resource expenditure substantial, we do not believe it would yield any meaningful data that could be analyzed by the Department or that could offer any practical utility in connection with the Department's regulatory impact analysis.

First, while certain of our member firms theoretically could provide PDFs of monthly account statements for particular accounts, all of those PDFs would need to be "sanitized" for personal information, which itself might take thousands of hours, and it is entirely unclear to us what the Department would do with this paper information for millions of accounts that cannot be collated or organized or analyzed other than manually. Our members cannot simply deliver to the Department unredacted documents containing client data without individual client consent. Most firms are understandably reluctant to ask their clients to consent to provide their personal financial information to a governmental agency, and even with that consent, we cannot identify under what FOIA exception you would be able to protect this material from public disclosure. Indeed, at our January 24 meeting, you were unable to address the industry's confidentiality concerns. Not only would disclosure raise concerns under other applicable laws, it could put clients' financial privacy at risk and endanger our members' relationships with their clients. As noted above, to attempt to remove client-specific information from a PDF file or system feed would be costly, labor intensive, and would still leave behind confidentiality concerns because enough trading information and possible other data might make a client identifiable.

While our members do maintain some of the information that the Department requested, as the Department may or may not be aware, firms keep the data in a variety of forms (which may differ from firm to firm and even from department to department within a firm). For example, some of the information that is specifically listed on the Department's request may be available only in PDF format at many member firms. Further, conditions exist that may call into question the quality of the data. For example the financial representative responsible for an account may have changed over time or the account type may have changed over time, and there may be no way to identify or flag those changes.

Moreover, the systems maintained across and even within our members were created in anticipation of certain foreseeable business or regulatory requests, but were never designed with the type of broad large scale survey request that the Department now makes. Indeed, a data request of the type requested by the Department is particularly challenging in light of changes over time to our members, such as system changes due to mergers, acquisition, or spin-offs as part of broader financial industry consolidation. There are also different systems between firms and within firms due to upgrades to programs, servers or other hardware. None of our members could merely push a button and pull the ten years of data the Department has requested.

Finally, different firms have different practices which lead to the retention of different information in different storage media and for different timeframes. The codes, categories and titling vary greatly among firms. All these challenges make it difficult or impossible to gather and compare data across firms without taking steps to make sure the data is uniform across firms. We see nothing in the Department's data requests that suggests how the Department might seek to do that and we assume the Department is not suggesting that we undertake the expense and time commitment to develop and implement a manual process that might seek to do that.

For all of these reasons, the specific data requested by the Department is not easily accessible or available to provide to the Department without significant cost both in expense and resources.

### **Potential Sources of Data**

In recent years, SIFMA has begun a joint research project maintained by the Investment Company Institute called The IRA Investor Database<sup>TM</sup>. This database includes certain account-level information on more than 10 million IRA investors; however, this database has certain limitations in the scope of the information. ICI submitted a recent letter to the Department explaining the database and those limitations, as well as the wealth of information that can be found within this database. We would encourage the Department to take a look at the material and reports prepared by the ICI in reliance on the database.

### **Data Retained in Database Format**

We continue to work with our members to find information that is kept in database format, common across firms and could be manipulated for data analysis by the Department. Once we determine what information is kept in database format and is accessible across multiple organizations with common sourcing or titling, we will still have challenges regarding the aggregation of this data, the potential format of the data and the scope of the data request (timeframe, etc.).

To that end, we have found common ground among our members in their daily trade blotters which include the amount of assets being bought or sold on a particular day, the price it is being sold at that day, the quantity and the trade date. Some firms have additional information, including CUSIP and commission; however, it appears that most firms hold that additional information on a different blotter, or in a different database that does not necessarily cross with the main daily trade blotter. As a result, the clear common categories we have identified are:

- An account number<sup>2</sup>
- A buy/sell order
- A price
- Quantity
- Trade date
- Ticker Symbol

---

<sup>2</sup> All account numbers would need to be masked before any data could be provided.

Please note that while these categories are common across most of our members who replied to this survey for data available in electronic form, the time frame over which the data is so maintained does not uniformly extend to the 10-year period the Department contemplated in its data request. There may be a handful of additional categories that multiple firms have in common; however, of the additional 226 categories identified, the same category did not appear on more than five firms' blotters. It is possible that some of the categories identified the same type of information but utilized different naming conventions; however, we were unable to make that differentiation in the short timeframe provided.

Even if the account information can be aggregated and provided to the Department in a format that would be practical for analysis and not overly costly and burdensome for the industry, we would like to understand the methodology the Department would use. We sincerely believe the Department has now correctly decided that before proposing a potentially costly and disruptive change to the definition of "fiduciary" under ERISA, it needs to undertake a thoughtful analysis to determine what the costs and benefits of any proposed changes and potential alternatives will be. Furthermore, some of our members question the timing and motivation behind this data request, which, when added to recent public statements by senior officials at the Department (e.g., "I didn't anticipate there would be an entire industry that without a statutory basis think they are above the law") raises concerns that, rather than undertaking an unbiased analysis, the Department merely is seeking to opportunistically pick amongst terabytes of data to provide a justification for changes it long ago decided to make.

Accordingly, we truly need to understand the Department's analytical framework and methodology before moving forward with a possible large-scale undertaking. Knowledge of the intended analysis could also inform the data points that would be useful to the Department's analysis. Having this information would also provide us an opportunity to work with the Department on its data request so that any information we agreed to provide would be directly related to the Department meeting its stated goal.

### **The SIFMA Oliver Wyman Study**<sup>3</sup>

In October 2010 SIFMA and Oliver Wyman submitted a study to the U.S. Securities and Exchange Commission (SEC) on the impact of implementing a harmonized fiduciary standard of conduct, which is attached. The study is also available at <http://www.sifma.org/issues/item.aspx?id=21999>. On November 17, 2010, SIFMA made a supplemental submission to the SEC to address the methodology of the study and the robustness of the data, among other things. The supplemental submission is available at <http://www.sifma.org/issues/item.aspx?id=22336>.

A key concern for the securities industry in implementing a harmonized fiduciary standard is how to better protect investors while preserving their choice of relationship, product access, and affordability of advisory services. The key insight from the SIFMA /Oliver Wyman study is that broker-dealers play a critical role in the financial services industry that cannot be easily replicated with alternative services models. Wholesale adoption of the Investment Advisers Act

---

<sup>3</sup> Please note that this Oliver Wyman Study is distinct from a later study coordinated by the Davis & Harman law firm, not commissioned by SIFMA, focused on the Department's change to the definition of fiduciary and submitted to the Department on April 12, 2011.

of 1940 for all brokerage activity is likely to have a negative impact on consumers (particularly smaller investors) across each of the following dimensions: choice, product access, and affordability of advisory services. Oliver Wyman collected data from a broad selection of retail brokerage firms to assess the impact of significant changes to the existing standard of conduct for broker-dealers and investment advisers.

We are currently investigating the ability to provide the Department with certain underlying data relating to this study. While certain data may no longer be accessible, certain other data may still be available. We will let you know as soon as we have identified the underlying information from that study that is still available.

### **Conclusion**

As the Department determines the utility of the particular information that current systems might capture and whether such a survey will assist the Department in determining the merits of any proposed rule, it is important to note that systems generally capture facts at a particular point in time, and not the conversation between the parties or the sophistication of the client, its guidelines, its risk parameters, *etc.* Investment ideas appropriately provided to a person at age 50 will be entirely different than those given to that same person at age 70. Investment ideas appropriately provided to an owner of a \$50,000 IRA with no other investible assets are different from those given to an IRA owner of a \$50,000 IRA with a significant 401(k) plan balance, a pension from a defined benefit plan, and substantial other assets. None of this context would be evident from the information the Department has requested.

We would also like to suggest that if the Department would share its work plan for the study with industry consultants and member firm IT personnel, together the parties might be able to identify a subset of data that would allow the Department to more quickly and economically achieve its goals.

We are committed to working with the Department to provide useful information for its economic impact analysis. We believe a mutually cooperative working environment between the Department, the trade organizations and our member firms is essential to ensure that any reproposal of the definition of “fiduciary” both sufficiently protects investors and can be implemented by those in the financial services industry without interrupting their ability to help those same investors make critical retirement decisions.

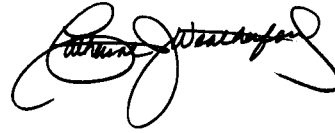

Please contact any of the undersigned if we can be of further assistance. In order to avoid potential timing issues associated with mailing correspondence, we provide our email addresses below, which we request you use in the future.

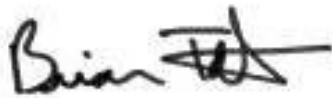

Sincerely,

3. **Background and context**
4. **Impact on choice**
5. **Impact on product access**
6. **Impact on cost to the consumer**

### **Appendix**

- Case study on impact of MiFID investor protection

Section 1

# Executive summary

## Summary findings (1)

- Oliver Wyman collected data from a broad selection of retail brokerage firms to assess the impact of significant changes to the existing standard of care for broker-dealers and investment advisors
  - A total of 17 firms provided data
  - These institutions serve 38.2MM households and manage \$6.8TN in client assets
  - The survey captures approximately 33% of households and 25% of retail financial assets in the US
- The primary issue at stake in the SEC 'standard of care' study is how to better protect the investor while preserving choice of relationship, product access, and affordability of advisory services
- The key insight from the survey is that broker-dealers play a critical role in the financial services industry that cannot be easily replicated with alternative services models
- Wholesale adoption of the Investment Advisers Act of 1940 for all brokerage activity is likely to have a negative impact on consumers (particularly smaller investors) across each of the following dimensions
  - Choice
  - Product access
  - Affordability of advisory services

**Continued...**

## Summary findings (2)

### Potential impact of rulemaking on retail investors

#### Choice

- Reduced access to the preferred 'investment and advisory model' for retail investors
  - 95% of households hold commission-based brokerage accounts today
  - The fee-based advisory platform is far less popular (only 5% of households)
  - The 'preference' for brokerage accounts is evident across all wealth segments but strongest for smaller investors with less than \$250K in assets

#### Product Access

- Reduced access to products distributed primarily through broker-dealers
  - Municipal and corporate bonds represent ~15% of assets held by retail investors
  - These products (among others) are generally offered on a 'principal basis'
  - Restricting principal or proprietary offerings will limit investor access to these products and possibly limit financing options for municipalities or corporates at current pricing

#### Affordability of Advisory Service

- Reduced access to the most affordable investment options
  - Fee-based services are 23-37 bps more expensive than brokerage<sup>1</sup>
  - For an investor with \$200K in assets, this translates to \$460 in additional fees
  - The cost of shifting to fee-based pricing alone would reduce expected returns by more than \$20K over a 20 year horizon (assuming 5% annual returns)
- And the indirect costs of additional compliance, disclosure, and surveillance may have an even greater impact on consumers → we estimate that 12-17MM small investors 'at the margin' could lose access to current levels of advisory service if even 2 additional hours of coverage and support is required per client

1. Cost expressed as a percentage of assets under management in basis points (1bp = 0.01%)

Section 2

# Methodology and source data

## Oliver Wyman collected data from 17 SIFMA member firms to support the impact assessment

### Purpose of study

- The impact assessment that follows was designed in response to the SEC request for comment on the upcoming study of the standard of care obligations for broker-dealers and investment advisers
- Oliver Wyman gathered data from 17 SIFMA member firms to provide relevant market data for the SEC study
- The study is intended to help
  - Identify the investor segments most likely to be affected by changes to the standard of care
  - Understand the cost to the consumer (choice, product access, transaction costs) of potential changes
  - Understand the one-time and ongoing costs of compliance for advisory and brokerage firms
  - Estimate the broader market / economic impact of any changes, particularly for capital formation

### Note on survey methodology

- 17 member firms participated, representing \$6.8TN in assets (approximately 27% of total U.S. household financial assets) across 38.2MM households
- To obtain a fairly representative sample of the industry, data on asset management accounts, investor profiles, and cost structure was gathered from a diverse set of brokerage firms

### Note on confidentiality

- Due to the highly sensitive nature of firm-specific information, all data is presented in aggregated form

**The survey proved to be highly representative of the investor population as a whole, capturing 33% of households and 27% of financial assets**

**Investors by wealth segment<sup>1</sup>**  
Number of U.S. households, 2009

**Assets by wealth segment**  
Investable assets, 2009

*Note: Economic data includes all investable assets whereas SIFMA data refers to managed assets, SIFMA data skews toward investors with <\$1MM in assets*

Section 3

# Background and context

## Regulators have wide discretion in establishing a uniform 'standard of care' for the IABD industry

- Regulators have a range of options in establishing a uniform 'standard of care' for broker-dealers and investment advisers in the United States
  - Limited changes to current model
  - A 'standard of care' with disclosure / consent to conflicts that preserves commission-based brokerage
  - Wholesale adoption of the Advisers Act of 1940 for all broker-dealers and investment advisers
- A major shift in the 'standard of care' will impact individual investors in several ways
  - Choice of advisory model
  - Access to investment products
  - Cost of investment and advisory services
- Beyond these direct costs to the consumer, we also anticipate broader economic costs to the industry as a whole
  - Broker-dealers and investment advisory firms will all face one-time and ongoing costs to comply with new fiduciary, disclosure, and surveillance requirements → these may be passed on to investors
  - Potential limitations on product accessibility for retail investors will place constraints on capital formation and issuers' ability to finance at attractive rates

**Our analysis will focus on the relative impact of two possible scenarios for harmonization of the standard of care**

| Activity                         | Rule making scenarios                                                                                                                        |                                                                                                                                                         |                                                                                                                                       |

***Baseline for impact analysis***

Section 4

## **Impact on choice**

# The vast majority (97%) of the US investor population holds less than \$1MM in assets with a broker-dealer or investment adviser

## Investor landscape (survey population)

Number of investors by wealth segment<sup>1</sup>, 2009

### Client assets under management

|         |         |         |         |
|---------|---------|---------|---------|
| \$1.3TN | \$1.9TN | \$1.8TN | \$1.8TN |
|---------|---------|---------|---------|

## Key observations

- 97% of investors in the survey (37.0MM) hold less than \$1MM in assets with broker-dealers or investment advisers
- Despite the heavy skew toward small clients, total assets are evenly distributed across the wealth spectrum (\$1.3-1.9TN in all groups)
- Average account balance for investors in the lowest wealth segment is \$40K → this is the segment most likely to be affected by a significant increase in costs

1. Wealth segments based on client assets under management

Source: SIFMA member data, 2007 Federal Reserve Survey of Consumer Finances, Oliver Wyman analysis

# Across wealth segments, less than 5% of investors use fee-based accounts alone to serve their investment needs

## Channel preference (survey population)

Number of households by relationship model, 2009

Source: SIFMA member data, 2007 Federal Reserve Survey of Consumer Finances, Oliver Wyman analysis

## The current model offers investors a wide range of advisory service, product access, and pricing options

| Key Attributes      | Account Types                                                                                                     |                                                                                                                                                             |                                                                                                                                                             |                                                                                                                 |

1. Non-advised accounts (e.g. self-directed online) were not targeted in this study but represent a significant subset of commission-based accounts

2. Range dependent on wealth segment (high end of the range reflects pricing for lowest wealth segment)

Section 5

## **Impact on product access**

# Direct holdings of individual securities (such as municipal bonds) represent an important element of investment strategy across all wealth segments

## Asset allocation (survey population)

Allocation of assets (%) by wealth segment, 2009

## Key observations

- Investors across all wealth segments have at least 30% of their portfolio in direct holdings of individual securities
- Municipal and corporate bonds offer tax and diversification benefits that investors may be unable to access via funds
- Across all investors, municipal and corporate bonds represent 13% of total wealth and 18% of invested assets (excluding cash)
- Allocations to municipal and corporate bonds range from 7% of investable assets for low net worth accounts to as high as 26% for high net worth accounts

1. Includes cash, currencies, money market funds, etc  
Source: SIFMA member data, Oliver Wyman analysis

# Commission-based brokerage is the primary channel for accessing these products today, especially for investors in the lowest wealth segment

**Low Net worth investors (<250K AUM)**  
Product access by account type<sup>2</sup>

**High Net Worth Investors (>5MM AUM)**  
Product access by account type

1. Cash and other includes cash, currencies, money market funds, etc.  
2. Non-discretionary, commission accounts and discretionary, fee accounts  
Source: SIFMA member data, Oliver Wyman analysis

# Individual investors hold 70% of municipal debt in the US today, both through direct and pooled investments

**Investor demand for Municipal Securities**  
Holdings of Municipal Securities by segment, \$TN

|          | 2004 | 2005 | 2006 | 2007 | 2008 | 2009 | 2010 |
|----------|------|------|------|------|------|------|------|
| Direct   | 37%  | 37%  | 36%  | 34%  | 34%  | 36%  | 36%  |
| Indirect | 34%  | 33%  | 34%  | 36%  | 36%  | 35%  | 34%  |

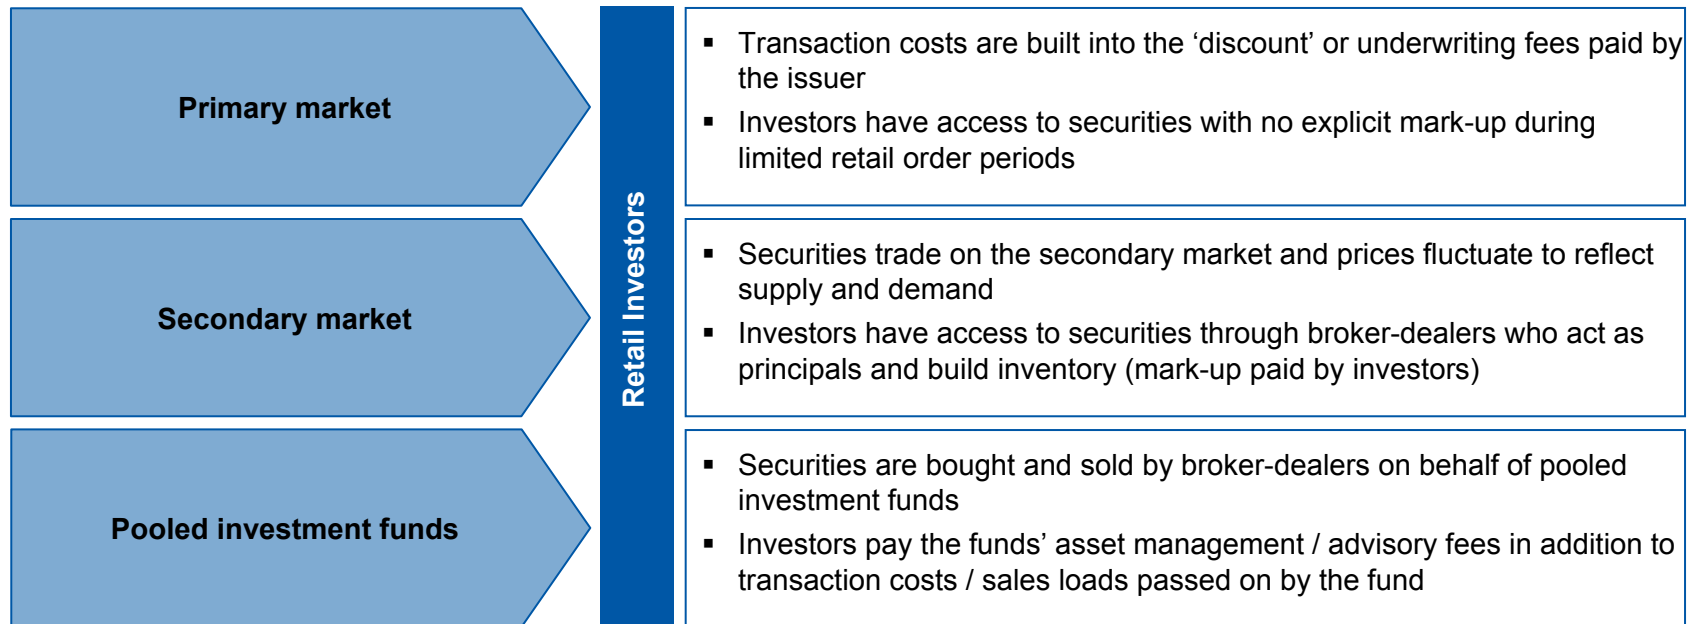

1. Other sectors include corporates, financial institutions, broker-dealers, and foreign entities  
Source: Federal Reserve

## Key observations

- The municipal securities market has grown steadily over the past several years and now provides nearly \$3TN in financing for state and local governments
- Municipalities in the U.S. have issued ~\$400BN debt annually over the past five years through these instruments
- The market is dominated by individual investors who hold ~ 70% of outstanding debt, split across direct exposures and pooled investments
- Financial institutions are relatively minor players in the space, collectively holding less than 30% of total assets (including broker-dealer inventories)
- A significant shift in the 'standard of care' required for origination and distribution of investments sold on a principal basis (as Munis are) could have a significant market impact along 2 dimensions
  - Access and cost for retail investors
  - Low cost financing for municipalities

**Broker-dealers play a key role in the Munis market, providing individual investors with direct and cost effective access to new issuances of these securities**

**Channels**

**Role of the broker-dealer**

- Direct, affordable access to municipal bonds for retail investors via primary and secondary principal trading desks → mutual funds are an alternative channel to Munis but at higher cost as management fees erode returns (~1% management fees vs. 4-5% average yield)

## Individual investors are also important participants in the corporate bond market

### Investor demand for Corporate and Foreign Bonds

Holdings of Corporate and Foreign Securities by segment, \$TN

|          |     |     |     |     |     |     |     |
|----------|-----|-----|-----|-----|-----|-----|-----|
| Direct   | 14% | 15% | 16% | 18% | 18% | 20% | 18% |
| Indirect | 18% | 17% | 18% | 18% | 18% | 18% | 19% |

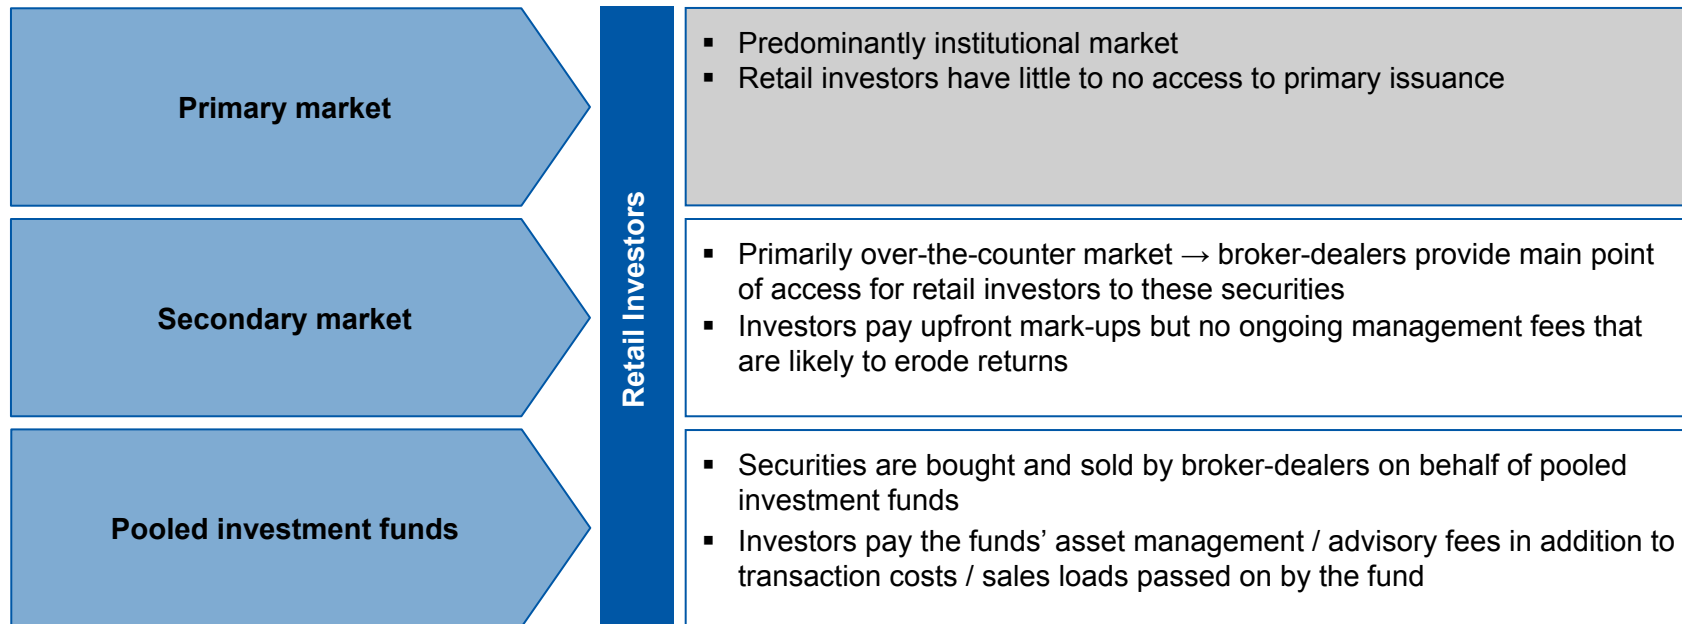

1. Other sectors include corporates, financial institutions, broker-dealers, and foreign entities  
Source: Federal Reserve

### Key observations

- Corporations and foreign entities rapidly increased issuance of new debt between 2004-2007 and have maintained annual new bond issuance of ~ \$11TN since the financial crisis
- Individual investors (via direct holdings or pooled investments) are the largest single class of investor in the corporate and foreign bond market
- Individual investors hold \$4.3TN or nearly 40% of outstanding debt today
- In absolute terms, individual investors' share of the corporate securities market is larger than municipal securities
- Capital formation for US corporates is driven in large part by individual investment

## Broker-dealers anticipate retail demand for corporate bonds and hold inventory to quickly, efficiently, and cost effectively meet client needs in the secondary market

### Channels

### Role of the broker-dealer

- Direct, affordable access to corporate bonds for retail investors via secondary principal trading desks → principal traders anticipate retail demand and build inventory that meets specific investment needs of clients

Section 6

## **Impact on cost**

## We have profiled three typical investors within each wealth segment to evaluate the potential costs of broad application of the Advisers Act of 1940<sup>1</sup>

|                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <p><b>B</b></p> <p><b>'Affluent Investor' with commission-based accounts</b></p> <p><i>7% of all investors</i></p>       | <ul style="list-style-type: none"> <li>▪ \$500K in assets held in commission-based accounts</li> <li>▪ Active investor with more than 10 trades per year (~75% of investors in \$250K-1MM segment)</li> <li>▪ Pays 53 bps or \$2,650 in commissions per year</li> <li>▪ Holds \$292K (59% of assets) in mutual funds and cash / cash equivalents</li> <li>▪ Holds \$117.5K (23% of assets) in equities</li> <li>▪ Hold \$90.5K (18% of assets) in fixed income, structured products and alternatives</li> </ul>                                           |
| <p><b>C</b></p> <p><b>'High Net Worth Investor' with commission-based accounts</b></p> <p><i>2% of all investors</i></p> | <ul style="list-style-type: none"> <li>▪ \$10MM in assets held in commission-based accounts</li> <li>▪ Active investor with more than 10 trades per year (~75% of investors in &gt;\$1MM segment)</li> <li>▪ Pays 38 bps or \$38,000 in commissions per year</li> <li>▪ Mutual funds and cash / cash equivalents together are \$4.1MM (41% of assets)</li> <li>▪ Equities are largest part of portfolio, with \$3.3MM invested (33% of assets)</li> <li>▪ Fixed income, structured products and alternatives represent \$2.6MM (26% of assets)</li> </ul> |

1. Asset allocation based on observed average asset allocation for each wealth segment  
Source: SIFMA member data, Oliver Wyman analysis

# Commission-based accounts provide the most cost effective option for investors across the wealth spectrum today

## Financial cost to consumer

Average annual fees and commissions, 2009

Average annual fees and commissions as % of AUM, 2009

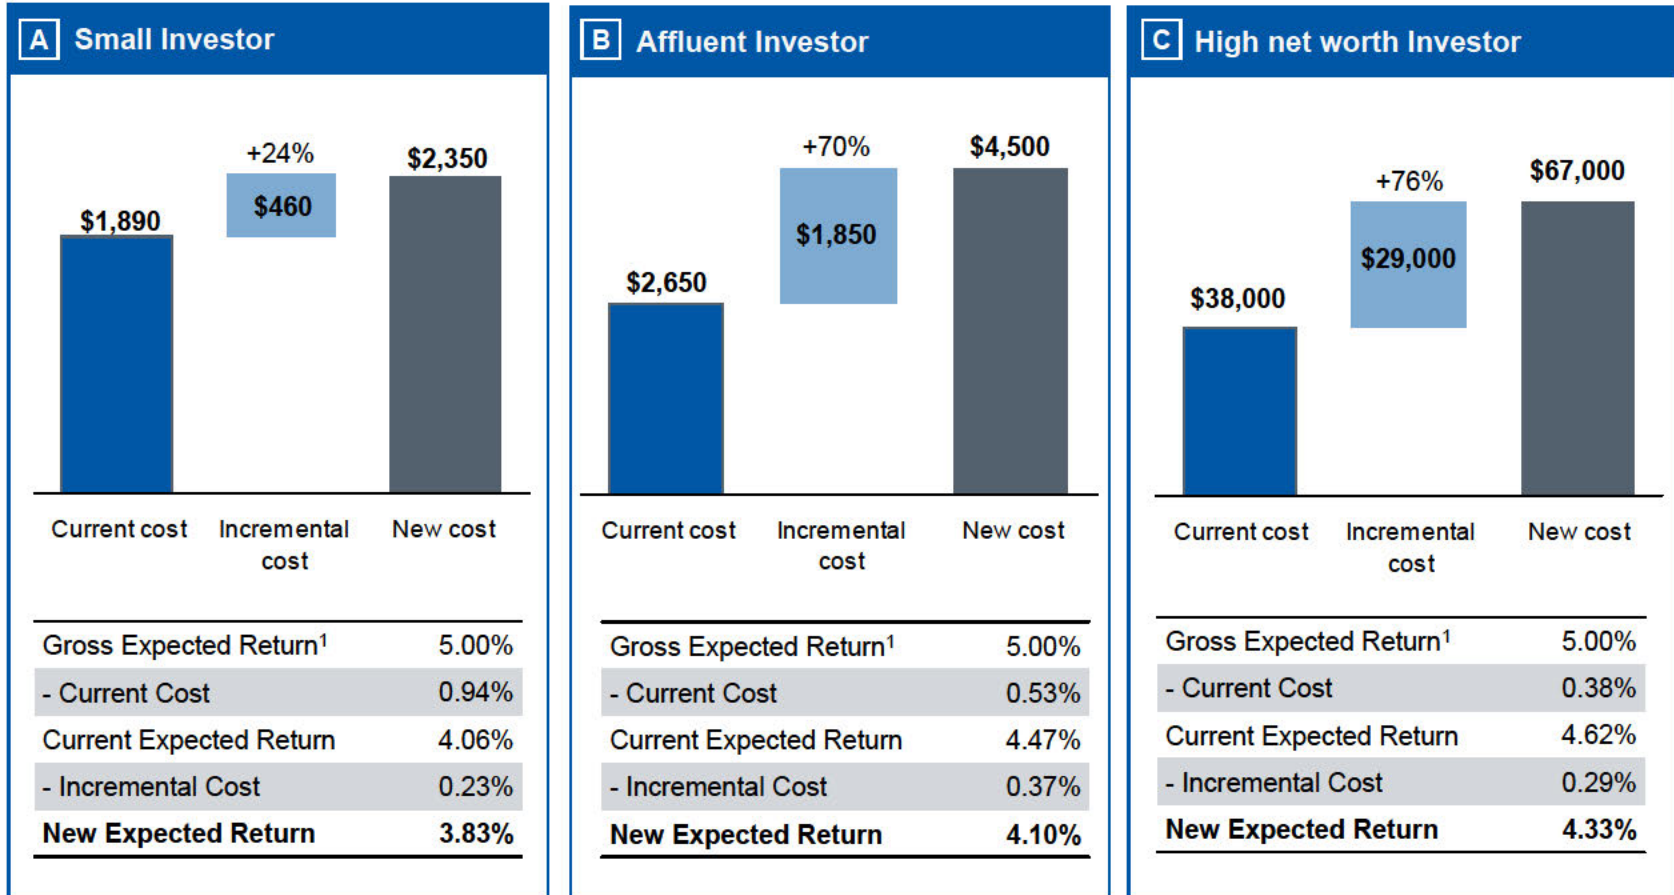

1. Based on existing balance of assets between fee-based and commission-based accounts  
 Source: SIFMA member data, Oliver Wyman analysis

## A broad shift to fee-based advisory would substantially increase costs across all wealth segments

### Potential impact on advisory fees and expected returns

Pro forma impact of transition to fee-based accounts at current pricing, annual advisory costs<sup>1</sup>

1. Assumes current pricing for commission- and fee-based accounts hold for all investors

2. Illustrative, not based on observed annual returns

Sources: SIFMA data, Oliver Wyman analysis

## The shift to a fee-based model would reduce cumulative returns to ‘small investor’ (with \$200K in assets) by \$20K over the next 20 years

### Impact of cost on investor returns

Expected investment gains on \$200K portfolio, 2010-2030<sup>1</sup>

### Key observations

- The average investor in the lowest wealth segment trades relatively infrequently over the course of the year
- As a result, a fee-based cost structure is generally more costly for these ‘passive investors’ and the incremental costs (+23 bps) erode returns
- For ‘small investor,’ a fee-based model results in a cumulative reduction in investment gains of \$20K over 10 years, roughly 10% of the initial investment
  - ‘Small investor’ would pay ~ \$59K in commissions over the course of 20 years through commission-based brokerage accounts
  - Under a fee-based advisory model, ‘small investor’ would pay an additional \$13K in fees and lose \$7K in investment gains as a result of lower principal balances each year

1. Assumes initial investment of \$200K in a balanced portfolio reflecting typical, balanced asset allocation for lower net worth investors with <\$250K AUM; based on constant annual returns of 5%, not adjusted for inflation; commissions deducted from principal balance starting at year end

## However, the costs of complying with and / or demonstrating compliance with the new standard of care will place additional pressure on pricing

### Increased activities required by shift in 'standard of care'

- Adviser training
- Increased legal and compliance
- Increased risk management and oversight
- Production and mailing of additional disclosures
- Initial client consultation
  - Review relationship
  - Obtain formal consent for existing strategy
- Investment strategy and plan
  - Evaluate portfolio
  - Assess investment objectives
  - Agree on new investment plan for client
- Documentation of client discussions
- Ongoing account surveillance

### Incremental cost of compliance

Annual costs expressed as bps over assets

| <i>Additional hours</i>             | 1            | 2            | 3            | 4            | 5              |
|-------------------------------------|--------------|--------------|--------------|--------------|----------------|
| <b>Estimated cost</b>               | <b>\$200</b> | <b>\$400</b> | <b>\$600</b> | <b>\$800</b> | <b>\$1,000</b> |
| <b>A</b> Small investor (\$200K)    | 10bps        | 20bps        | 30bps        | 40bps        | 50bps          |

| <b>C</b> HNW investor (\$10MM)      | 2bps         | 4bps         | 6bps         | 8bps         | 10bps          |

■ Focus of analysis on following slides (conservative estimate)

### Methodology for calculating hourly rate

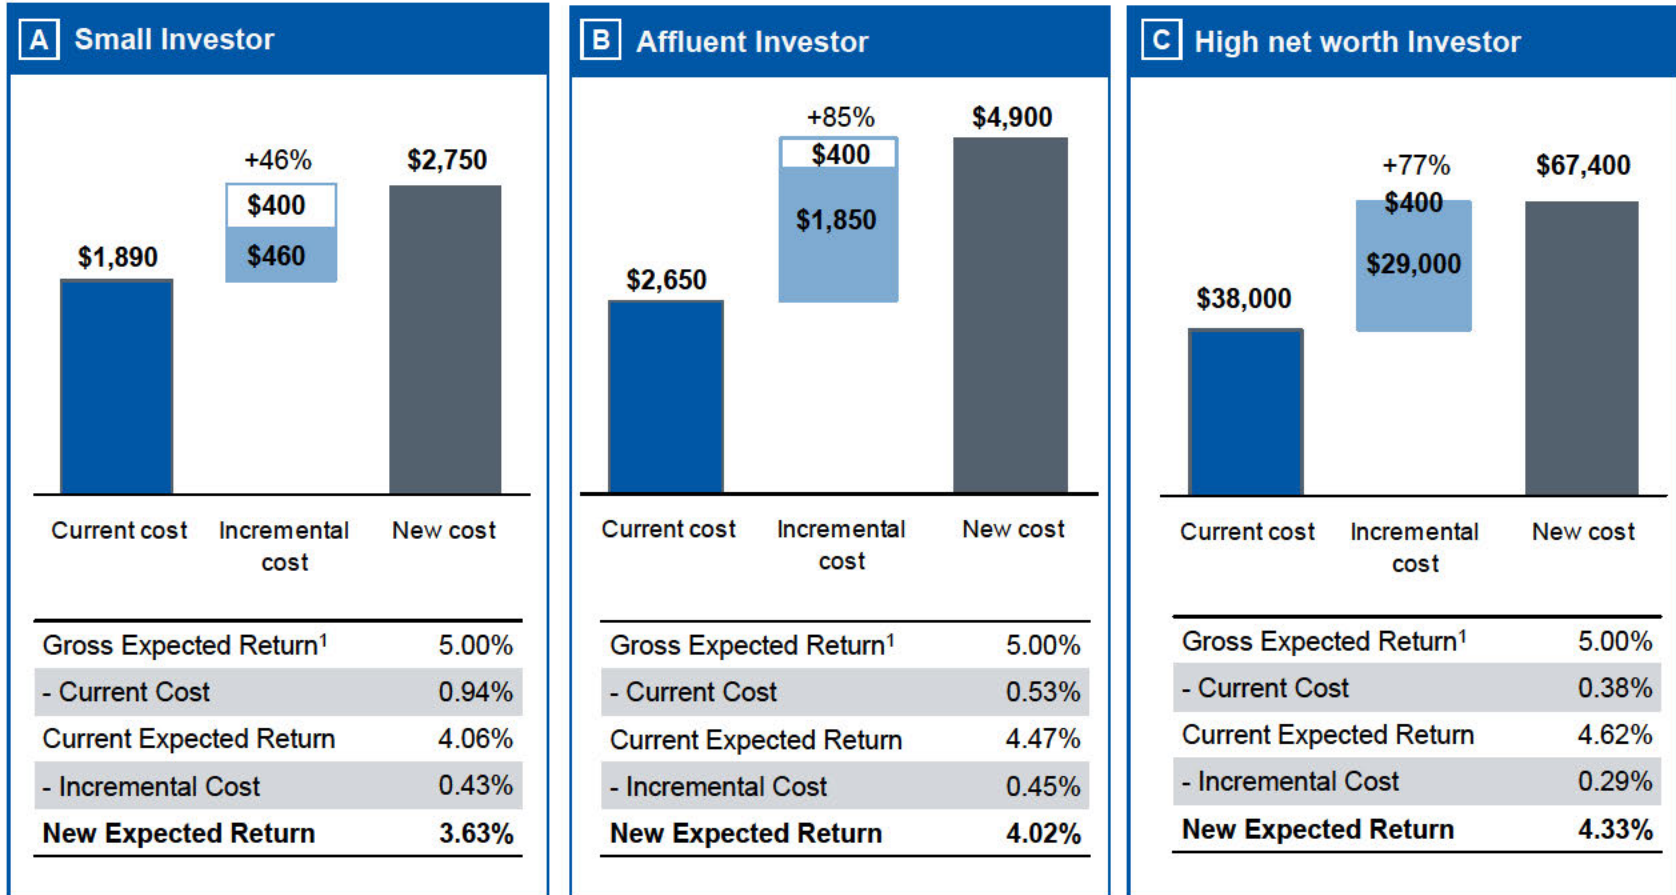

- Median income for investment advisers estimated at \$173K<sup>1</sup>
- Adviser compensation represents 42% of fully loaded costs based on SIFMA member data
- Given 2,000 working hours per year, average hourly rate of service is \$200 / hour

1. Based on 2010 annual compensation survey by Registered Rep  
Source: SIFMA member data, Oliver Wyman analysis

## These incremental costs will disproportionately impact investors with smaller investment portfolios

### Potential impact on advisory fees and expected returns

Pro forma impact of transition to fee-based accounts at new pricing, annual advisory costs

1. Assumes pricing for commission- and fee-based accounts rises to account for additional activity

2. Illustrative, not based on observed annual returns

Sources: SIFMA data, Oliver Wyman analysis

## Consumers may also face significant adviser capacity constraints that will limit the availability of service under the new standard of care

### Capacity analysis

#### Current state

|                                               |              |
|-----------------------------------------------|--------------|
| Investors with <\$250K in commission accounts | 28.4MM       |
| Average commissions/investor                  | \$268        |
| Hourly rate for asset management services     | \$200        |
| Time spent per investor                       | 1.3 hours    |
| Time spent on all investors with <\$250K AUM  | 38.1MM hours |
| Minimum number of required advisers           | 19K          |

#### Impact of additional service requirements

+ 2 hours per investor

| Current utilization levels             | 70%  | 80%  | 90%  | 100% |
|----------------------------------------|------|------|------|------|
| Implied capacity (MM hours)            | 54.4 | 47.6 | 42.3 | 38.1 |
| Implied capacity (total investors, MM) | 16.3 | 14.3 | 12.7 | 11.4 |
| Coverage gap (total investors, MM)     | 12.1 | 14.2 | 15.8 | 17.0 |
| Additional advisers needed             | 20K  | 24K  | 26K  | 28K  |

### Implications

- Given current resources, we estimate that 40-57% of investors in the lowest wealth segment can be covered if advisers are required to spend 2 additional hours with each investor
- We estimate that 20-28K additional advisers will be needed to serve the 'uncovered' investors in our sample population → our sample population is 33% of US investors, which suggests that 60-84K new advisers may be needed
- Faced with this, the brokerage and investment advisory industry can respond in one of three ways
  - Increase workforce and raise prices
  - Increase workforce and absorb new costs
  - Reduce coverage for lower net worth investors whose 'personalized investment' advisory needs will exceed capacity
- While the autonomy provided by self-directed accounts is desirable for certain investors, market data suggests that investors with advised accounts
  - Make more sophisticated investment decisions
  - Achieve higher average investment returns

Source: SIFMA member data, Oliver Wyman analysis

# Current economics of the IA/BD industry suggest that investors will need to accept higher costs or turn to alternative service models for investment

## Industry profitability

Total costs before tax over total revenues<sup>1</sup>

**Operating margins across the industry are thin and have deteriorated since 2005, leaving little room to absorb additional cost**

## Industry capacity

FINRA registered representatives (000s)<sup>2</sup>

**Industry headcount has been flat to negative over the past ten years; the additional capacity required to cover small clients would be difficult to provide (at least in the near term)**

1. Public data for companies within the SNL National Broker-Dealer, Regional Broker-Dealer, and Discount Broker indices

2. Figures overstate actual industry capacity (approximately 50-60% of individuals who hold Series 7 licenses do not advise investors, but serve in other capacities e.g. legal, compliance, etc.)

Sources: SNL Financial, FINRA

## And several recent studies suggest that investors without access to advisory services may be disadvantaged and fail to realize investment goals

### Impact of professional financial advice<sup>1</sup> on portfolio returns 401k returns by age segment, 2006 data

### Key observations

- Participants in 401k plans administered by Schwab achieved returns that were 3.3% higher on average if some level of financial advice was provided
- In addition to higher portfolio returns, professional financial advice had an impact on several dimensions
  - Savings rate → 70% of participants who received financial advice doubled their saving rates from an average of 5% to 10% of pre-tax income
  - Portfolio diversification → Participants who received financial advice held positions across 8 asset classes on average vs. self-directed investors who held positions in 3.7
  - Investor confidence → Of participants who received advice, 29% were confident of having adequate funds to retire vs. 16% of investors who did not

1. Use of advisory services for >1 year, 'advisory services' include personalized investment advice online, via phone, or in person  
Source: Charles Schwab studies on 401(k) portfolio returns (2007) and impact of professional advisory relationships in 401(k) plans (2010)

Appendix

# MiFID Investor Protection

## In 2007, the Markets in Financial Instruments Directive (MiFID) made significant provisions for ‘investor protection’

### MiFID provisions

- Regulation of alternative trading systems
  - Regulation of multi-lateral trading facilities
  - Treatment of systemic internalisers, or principal traders, as mini-exchanges
- Increased pre and post trade transparency for all trading facilities
- Passporting or development of a single market for transactions in financial instruments across a number of European Union member states
- Requirement to enhance corporate governance structures to accommodate an independent compliance function
- Investor protection
  - Appropriate client categorization and client order handling
  - Best execution requirement for all trades on behalf of clients
  - Robust record keeping systems for periodic statements, transaction reporting, and client contracts and agreements

### MiFID relative to Advisers Act of 1940

- MiFID provisions covered a narrower range of activities and imposed a less onerous standard of care than the ‘best interest’ standards that would be required if the Advisers Act were adopted

|                           | MiFID       |               |
|---------------------------|-------------|---------------|
|                           | Suitability | Best interest |
| Investment planning       | ✓           | ✗             |
| Asset allocation advice   | ✓           | ✗             |
| Advice on client holdings | ✓           | ✗             |
| Proprietary product sales | ✓           | ✗             |
| Underwriting              | Not covered |               |
| Principal trading         | ✓           | ✗             |
| IRA / retirement accounts | ✓           | ✗             |

**Although less onerous than the ‘standard of care’ currently under consideration in the US, MiFID studies nonetheless show the impact of similar compliance costs on asset management firms**

## The FSA's impact studies on MiFID identified investor protection provisions as the greatest contributors to compliance costs

|                           | Activity                                | Objective                                                                                                           | Cost Factors                                                                                            | Cost Drivers                                                                                   |

Source: Implementing MiFID for Firms and Markets, FSA Consultation Paper 2006

## Smaller firms with a large retail client base incurred higher one-off costs of compliance as a percentage of operating costs

**One-off compliance costs of MiFID by firm size<sup>1</sup>**  
One-off costs as a percentage of operating costs, 2007

1. Firms with fewer than 100 employees were classified as "Small"  
Source: Europe Economics Study, 2007

### Determinants of one-off costs

- The study found that client profile is the most important determinant of costs, with retail clients incurring significantly more costs than institutional clients
- The biggest one-off costs arose from investment in IT and revisions of CRM systems to reflect new data points, especially for certain retail segments
- A significant portion of one-off costs were fixed, irrespective of firm size and number of clients
- Impact studies indicated that small firms would be unable to sustain large fixed costs of compliance and exit the industry
- In absolute terms, average one-off costs were ~€1 MM for a small firm and ~€4 MM for a large firm
- There is high variability in the level of one-off costs amongst smaller firms depending upon
  - Extent to which firms serve retail clients
  - Ability of firms to make large upfront investments

**Due to their inability to make sizeable upfront investments, smaller firms typically also sustained higher ongoing costs of compliance as a percent of operating costs**

**On-going compliance costs of MiFID**  
European asset managers by firm size<sup>1</sup>, 2007

|                           | Small | Large |
|---------------------------|-------|-------|
| <b>Additional staff</b>   | 70%   | 18%   |
| <b>Internal reporting</b> | 9%    | 12%   |
| <b>IT</b>                 | 4%    | 30%   |
| <b>External reporting</b> | 12%   | 17%   |
| <b>Training</b>           | 2%    | 7%    |
| <b>Audit</b>              | 2%    | 16%   |

**Ongoing compliance costs of MiFID by firm size**  
Ongoing costs as a percentage of operating costs, 2007

- Whereas larger asset managers complied with MiFID by investing in automated systems, smaller firms increased headcount
- There is a trade-off between one-off and on-going costs, e.g. for smaller firms the option of updating IT systems might have been too expensive, thus on-going costs of sustaining a larger workforce are much higher
- The smallest firms in the study had no specialist compliance functions prior to MiFID, and required significant resources to cover compliance activities

1. Firms with fewer than 100 employees were classified as "Small"

**Subject:** EBSA Question

Hi Karen, my name is Thoreau Bartmann and I work with Mark here in Investment Management at the SEC. Mark passed your question on to me-I would be happy to try and help answer your questions the best I can. I am also CCing a colleague of mine in our trading and markets division who may be able to provide some insight into the broker side of your questions. Perhaps we can set up a call tomorrow or next week to discuss your questions? We may not be able to answer everything right away, but if we get a better sense of what you want to know we should be able to get you answers or put you in contact with the right people here at the SEC who can help.

I am free most of the afternoon this Friday and Monday-let me know what time works for you.  
Thanks,

***Thoreau Bartmann***

Subject: Question from EBSA

Hi Mark,

You and I were on a call together recently regarding the proposed amendments to EBSA's class exemptions to remove credit ratings, per Dodd-Frank. I remember that you said you acted as our liaison for SEC questions, and I was hoping to take you up on that.

We were hoping to talk to someone briefly about the mechanics of mutual fund shares purchases/sales, particularly the circumstances in which a purchase can be made by a broker as an agent on behalf of an employee plan, as opposed to in a principal transaction. It is our understanding that section 22(d) of the Investment Company Act references sales by "dealers" and we want to clarify whether that precludes sales in which a broker is acting as agent. We also want to confirm our understanding of the possible fees that a broker may charge in connection with transactions involving no-load funds.

Would you be able to put us in touch with someone on this issue?

Thanks so much,

Hi Karen -

We checked our calendars, and it seems that we could do a call sometime between 1-3 on Friday, if that works for you. We may suggest on the earlier side, if possible, only because of the holiday weekend (people may be running out earlier than currently reflected on their calendars).

Thanks,

Emily

Hi Karen -

Thank you so much for your email and for coming to meet with us last week. Your email is timely, as we were just following up internally with our staff experts on the matters addressed in the draft exemption.  
Looking at our collective calendars, it seems we are available the afternoon of August 26th or the morning of

August 27th, if there is an hour or so in either of those time frames that works for you and your team. We are happy to do by phone, if that works best for all involved.

Thanks,

Emily

Hi Emily,

I am one of the EBSA people who attended the meeting last week on the fiduciary rule. I work on the class exemptions. We are very interested in any feedback the SEC staff can provide on our principal transactions draft exemption. Would it be possible to put a meeting or call on the calendar to discuss it? I am out on vacation next week but will be in the week of August 26, if that is a possibility at all.

Thank you for your help,

-Karen

**Subject:** RE: Follow up

Karen,

I have information for investment advisers but I will have to send the information for broker-dealers later (hopefully tomorrow). I copied Sarah from our Division of Investment Management in case you have follow-up questions about the following.

In general, there is not a definition of "material conflict of interest" in the Advisers Act, but there are certain principles, such as what a reasonable investor might consider material, and the idea that a material conflict is one that could cause an adviser to provide advice that was not disinterested. For example:

- SEC staff said in the "Information for Newly-Registered Advisers" that "Generally, facts are "material" if a reasonable investor would consider them to be important."  
<http://www.sec.gov/divisions/investment/advoverview.htm>.
- In the Capital Gains Supreme Court decision: "[t]he Investment Advisers Act of 1940 reflects a congressional recognition of the delicate fiduciary nature of an investment advisory relationship as well as a congressional intent to eliminate, or at least to expose, all conflicts of interest which might incline an investment adviser—consciously or unconsciously—to render advice which was not disinterested." It doesn't say "material" but that would be the assumption, as the Commission has said that an adviser has a duty to disclose material conflicts of interest (see, e.g. Amendments to Form ADV, Advisers Act Rel. No. 3060 (July 28, 2010)).
- This principle is also in Basic v. Levinson where the Supreme Court said in the proxy solicitation context that materiality depends on the significance the reasonable investor would place on the withheld or misrepresented information. That case is attached.

Please let us know if you have any questions or need anything additional on this. Again, I will send information for broker-dealers in a separate email.

Thanks,

Jen

Hi Jen,

Thank you for your help earlier today. I had one additional question -- I am sorry to ask you this just before the holiday, please don't feel like you have to get right back to me. Can you point me to a securities law cite on "materiality" as it might relate to conflicts of interest?

Thanks,  
Karen

Hi Karen.

This is outside my area. I'm copying my counterpart in the financial responsibility group, Tom McGowan, to see if he can help you. I suspect he'll need more facts to help answer your question.

Rule 10b-16 is about disclosure of margin terms. Think of it as Truth in Lending disclosure for brokers. I'm not familiar with that FINRA rule but I can facilitate a conversation with FINRA if you decide you want to talk to them.

**Subject:** Questions from DOL on brokers extensions of credit

Hi Lourdes,

I'm part of the DOL team working on the fiduciary project. Thank you for all of the time you have spent assisting us with the project. We have some discrete questions on another exemption related to our fiduciary project. If you have time, we would like to discuss securities laws requirements regarding extensions of credit between brokers and their clients. (This would be just a few people in the Office of Exemption Determinations, not our whole group.)

Specifically, the question relates to broker-dealers extending credit to clients to avoid a failed securities transaction. Because extending credit/receiving compensation for the extension of credit are prohibited transactions, we have been told that an exemption is necessary for brokers who become fiduciaries to continue to do this. We would like to understand primarily whether this type of extension of credit is *required* of brokers under the securities laws -- are they required to step in if their customers do not perform obligations under a trade? Further we would like to know what (if any) disclosure requirements or other requirements apply in connection with these types of extensions of credit. We have come across FINRA Rule 11810 and Securities Exchange Act Rule 10b-16 but are not sure if both apply (10b-16 seems to apply to margin transactions only?).

We would really appreciate any guidance that you can give you on this issue.

Karen

Lona – I think our respective bosses' schedulers are trying to find a new time for the call that we unfortunately missed yesterday. Once the call gets rescheduled, I've asked Ronetta in my office to find time for the follow up call we discussed yesterday. Secretary Perez asked me in the meantime to make sure that Chair White gets the attached document, which he referred to in their last conversation. It reflects data from Chair Griffith Jones of the UK Financial Conduct Authority about what they are seeing as a result of the implementation of their advice reform regulation. Thanks,

Thanks, Sharon. I was very nice to meet you.

During our meeting Mary Jo mentioned to the Secretary that FINRA recently issued its Regulatory Examinations Priorities Letter and the letter had a reference to FINRA's perspective on interests of a client. It is a small reference, but an interesting one. I have attached the letter and I have highlighted the section on page 2. I was hoping you could pass this on to the Secretary, if you think he would be interested in looking at this.

I hope you have a nice weekend.

Dear Chris,

Unfortunately I have not been able to get through all of the comment letters as of yet, but there are a few that do provide some form of quantitative information. These include

Financial Planning Coalition

<http://www.sec.gov/comments/4-606/4606-3126.pdf>

Charles Schwab

<http://www.sec.gov/comments/4-606/4606-3137.pdf>

sifma (including info on IRA accounts)

<http://www.sec.gov/comments/4-606/4606-3128.pdf>

Financial Services Institute

<http://www.sec.gov/comments/4-606/4606-3138.pdf>

State Farm Investment Management Corp

<http://www.sec.gov/comments/4-606/4606-3104.pdf>

Also, the letter from the Consumer Federation of America is worth a read.

<http://www.sec.gov/comments/4-606/4606-3119.pdf>

Lastly, the attached paper came across my desk recently. I am sure you are probably already aware of it but just in case you are not...

To my knowledge we have not received any kind of dataset with account level or other granular information. I will let you know if I come across any other interesting/applicable comment letters. Please ask if you have any questions.

Hi Matt,

We are available for the Thursday time slot (June 20<sup>th</sup>, 9-10am). I'll send out an Outlook invite. Who else should be on it on your side?

On our last phone call, you had mentioned that you would compile some written comments based on your and Jennifer's reactions to our draft. Would you be able to send those before the phone call?

Please send our thanks to Lourdes for the examples of referring to indexes.

Thanks,  
Keith

In the product definitions adopting release regarding swaps (see attached), the Commission discussed the nature of security indexes in general (see pp. 48285-6). However, we did not address whether specific indexes are broad or narrow-based, under the definitions of swap and security-based swap jointly adopted by the Commission and the CFTC.

---

Please check Sections 3 and 6 of Chapter XIV in the following link that should lead you to NASDAQ's index options standards:

<http://nasdaq.cchwallstreet.com/NASDAQTools/PlatformViewer.asp?selectednode=chp%5F1%5F1%5F14&manual=%2Fnasdaq%2Fmain%2Fnasdaq%2Doptionsrules%2F>

I've cut and pasted these Sections below as well. You'll notice that the criteria may differ, depending on the specific underlying index (MSCI) named in the rule:

### **Sec. 3 Designation of a Broad-Based Index**

(a) The component securities of an index underlying a broad-based index option contract need not meet the requirements of Section 3 of Chapter IV of these Rules (Criteria for Underlying Securities). Except as set forth in subparagraph (b) below, the listing of a class of index options on a broad-based index requires the filing of a proposed rule change to be approved by the SEC under Section 19(b) of the Exchange Act.

(b) NOM may trade options on a broad-based index pursuant to Rule 19b-4(e) of the Securities Exchange Act of 1934, if each of the following conditions is satisfied:

- (1) The index is broad-based, as defined in Section 2(j) of this Chapter;
- (2) Options on the index are designated as A.M.-settled;
- (3) The index is capitalization-weighted, modified capitalization weighted, price-weighted, or equal dollar-weighted;
- (4) The index consists of 50 or more component securities;
- (5) Component securities that account for at least ninety-five percent (95%) of the weight of the index have a market capitalization of at least \$75 million, except that component securities that account for at least sixty-five percent (65%) of the weight of the index have a market capitalization of at least \$100 million;
- (6) Component securities that account for at least eighty percent (80%) of the weight of the index satisfy the requirements of Section 3 of Chapter IV applicable to individual underlying securities;
- (7) Each component security that accounts for at least one percent (1%) of the weight of the index has an average daily trading volume of at least 90,000 shares during the last six month period;
- (8) No single component security accounts for more than ten percent (10%) of the weight of the index, and the five highest weighted component securities in the index do not, in the aggregate, account for more than thirty-three percent (33%) of the weight of the index;
- (9) Each component security must be an "NMS stock" as defined in Rule 600 of Regulation NMS under the Exchange Act;
- (10) Non-U.S. component securities (stocks or ADRs) that are not subject to comprehensive surveillance agreements do not, in the aggregate, represent more than twenty percent (20%) of the weight of the index;
- (11) The current index value is widely disseminated at least once every fifteen (15) seconds by OPRA, CTA/CQ, NIDS or one or more major market data vendors during the time options on the index are traded on NOM;
- (12) NOM reasonably believes it has adequate system capacity to support the trading of options on the index, based on a calculation of NOM's current Independent System Capacity Advisor allocation and the number of new messages per second expected to be generated by options on such index;
- (13) An equal dollar-weighted index is rebalanced at least once every calendar quarter;
- (14) If an index is maintained by a broker-dealer, the index is calculated by a third-party who is not a broker-dealer, and the broker-dealer has erected an informational barrier around its personnel who have access to information concerning changes in, and adjustments to, the index;
- (15) NOM has written surveillance procedures in place with respect to surveillance of trading of options on the index.

(c) The following maintenance listing standards shall apply to each class of index options originally listed pursuant to paragraph (b) above:

- (1) The requirements set forth in subparagraphs (b)(1) - (b)(3) and (b)(9) - (b)(15) must continue to be satisfied. The requirements set forth in subparagraphs (b)(5) - (b)(8) must be satisfied only as of the first day of January and July in each year;
- (2) The total number of component securities in the index may not increase or decrease by more than ten percent (10%) from the number of component securities in the index at the time of its initial listing. In the event a class of index options listed on NOM fails to satisfy the maintenance listing standards set forth herein, NOM shall not open for trading any additional series of options of that class unless the continued listing of that class of index options has been approved by the SEC under Section 19(b) (2) of the Exchange Act.

(d) MSCI EM Index

- (i) NOM may trade options on the MSCI EM Index if each of the following conditions is

satisfied:

- (1) The index is broad-based, as defined in Chapter XIV, Section 2(j);
  - (2) Options on the index are designated as P.M.-settled index options;
  - (3) The index is capitalization-weighted, price-weighted, modified capitalization-weighted or equal dollar-weighted;
  - (4) The index consists of 500 or more component securities;
  - (5) All of the component securities of the index will have a market capitalization of greater than \$100 million;
  - (6) No single component security accounts for more than fifteen percent (15%) of the weight of the index, and the five highest weighted component securities in the index do not, in the aggregate, account for more than fifty percent (50%) of the weight of the MSCI EM Index;
  - (7) Non-U.S. component securities (stocks or ADRs) that are not subject to comprehensive surveillance agreements do not, in the aggregate, represent more than twenty-two and a half percent (22.5%) of the weight of the index;
  - (8) The current index value is widely disseminated at least once every fifteen (15) seconds by one or more major market data vendors during the time options on the index are traded on NOM;
  - (9) NOM reasonably believes it has adequate system capacity to support the trading of options on the index, based on a calculation of NOM's current Independent System Capacity Advisor (ISCA) allocation and the number of new messages per second expected to be generated by options on such index; and
  - (10) NOM has written surveillance procedures in place with respect to surveillance of trading of options on the index.
- (ii) The following maintenance listing standards shall apply to each class of index options originally listed pursuant to paragraph (d).
- (1) The conditions set forth in subparagraphs (d)(i) (1), (2), (3), (4), (7) (8), (9) and (10) must continue to be satisfied. The conditions set forth in subparagraphs (d)(i) (5) and (6) must be satisfied only as of the first day of January and July in each year;
  - (2) The total number of component securities in the index may not increase or decrease by more than thirty-five percent (35%) from the number of component securities in the index at the time of its initial listing.

In the event a class of index options listed on NOM fails to satisfy the maintenance listing standards set forth herein, NOM shall not open for trading any additional series of options of that class unless the continued listing of that class of index options has been approved by the Commission under Section 19(b)(2) of the Exchange Act.

(e) MSCI EAFE Index

- (i) NOM may trade options on the MSCI EAFE Index if each of the following conditions is satisfied:
- (1) The index is broad-based, as defined in Chapter XIV, Section 2(j);
  - (2) Options on the index are designated as P.M.-settled index options;
  - (3) The index is capitalization-weighted, price-weighted, modified capitalization-weighted or equal dollar-weighted;
  - (4) The index consists of 500 or more component securities;
  - (5) All of the component securities of the index will have a market capitalization of greater than \$100 million;
  - (6) No single component security accounts for more than fifteen percent (15%) of the weight of the index, and the five highest weighted component securities in the index do not, in the aggregate, account for more than fifty percent (50%) of the weight of the MSCI EAFE Index;
  - (7) Non-U.S. component securities (stocks or ADRs) that are not subject to comprehensive surveillance agreements do not, in the aggregate, represent more than twenty percent (20%) of the weight of the index;
  - (8) The current index value is widely disseminated at least once every fifteen (15) seconds by one or more major market data vendors during the time options on the index are traded on NOM;
  - (9) NOM reasonably believes it has adequate system capacity to support the trading of

- options on the index, based on a calculation of the NOM's current Independent System Capacity Advisor (ISCA) allocation and the number of new messages per second expected to be generated by options on such index; and
- (10) NOM has written surveillance procedures in place with respect to surveillance of trading of options on the index.
- (ii) The following maintenance listing standards shall apply to each class of index options originally listed pursuant to paragraph (e).
- (1) The conditions set forth in subparagraphs (e)(i) (1), (2), (3), (4), (7) (8), (9) and (10) must continue to be satisfied. The conditions set forth in subparagraphs (e)(i) (5) and (6) must be satisfied only as of the first day of January and July in each year;
- (2) The total number of component securities in the index may not increase or decrease by more than thirty-five percent (35%) from the number of component securities in the index at the time of its initial listing.
- In the event a class of index options listed on NOM fails to satisfy the maintenance listing standards set forth herein, NOM shall not open for trading any additional series of options of that class unless the continued listing of that class of index options has been approved by the Commission under Section 19(b)(2) of the Exchange Act.

## **Sec. 6 Designation of Narrow-Base and Micro-Narrow-Based Index Options**

- (a) The component securities of an index underlying a narrow-based index option contract need not meet the requirements of Section 3 of Chapter IV of these Rules (Criteria for Underlying Securities). Except as set forth in subparagraph (b) below, the listing of a class of index options on a narrow-based index requires the filing of a proposed rule change to be approved by the SEC under Section 19(b) of the Exchange Act.
- (b) *Narrow-Based Index*. NOM may trade options on a narrow-based index pursuant to Rule 19b-4(e) of the 1934 Act, if each of the following conditions is satisfied:
- (1) The options are designated as A.M.-settled index options;
- (2) The index is capitalization-weighted, price-weighted, equal dollar-weighted, or modified capitalization-weighted, and consists of ten or more component securities;
- (3) Each component security has a market capitalization of at least \$75 million, except that for each of the lowest weighted component securities in the index that in the aggregate account for no more than 10% of the weight of the index, the market capitalization is at least \$50 million;
- (4) Trading volume of each component security has been at least one million shares for each of the last six months, except that for each of the lowest weighted component securities in the index that in the aggregate account for no more than 10% of the weight of the index, trading volume has been at least 500,000 shares for each of the last six months;
- (5) In a capitalization-weighted index or a modified capitalization-weighted index, the lesser of the five highest weighted component securities in the index or the highest weighted component securities in the index that in the aggregate represent at least 30% of the total number of component securities in the index each have had an average monthly trading volume of at least 2,000,000 shares over the past six months;
- (6) No single component security represents more than 30% of the weight of the index, and the five highest weighted component securities in the index do not in the aggregate account for more than 50% (65% for an index consisting of fewer than 25 component securities) of the weight of the index;
- (7) Component securities that account for at least 90% of the weight of the index and at least

80% of the total number of component securities in the index satisfy the requirements of Chapter IV, Section 3 applicable to individual underlying securities;

(8) Each component security must be an "NMS stock" as defined in Rule 600 of Regulation NMS of the Securities Exchange Act of 1934.

(9) Non-U.S. component securities (stocks or ADRs) that are not subject to comprehensive surveillance agreements do not in the aggregate represent more than 20% of the weight of the index;

(10) The current underlying index value will be reported at least once every fifteen seconds during the time the index options are traded on the Exchange;

(11) An equal dollar-weighted index will be rebalanced at least once every calendar quarter; and

(12) If an underlying index is maintained by a broker-dealer, the index is calculated by a third party who is not a brokerdealer, and the broker-dealer has erected a "Chinese Wall" around its personnel who have access to information concerning changes in and adjustments to the index.

(c) *Maintenance Criteria.* The following maintenance listing standards shall apply to each class of index options originally listed pursuant to subsection (b) above:

(1) The requirements stated in subsections (b)(1), (3), (6), (7), (8), (9), (10), (11) and (12) must continue to be satisfied, provided that the requirements stated in subparagraph (b)(6) must be satisfied only as of the first day of January and July in each year;

(2) The total number of component securities in the index may not increase or decrease by more than 33 1/3% from the number of component securities in the index at the time of its initial listing, and in no event may be less than nine component securities;

(3) Trading volume of each component security in the index must be at least 500,000 shares for each of the last six months, except that for each of the lowest weighted component securities in the index that in the aggregate account for no more than 10% of the weight of the index, trading volume must be at least 400,000 shares for each of the last six months;

(4) In a capitalization-weighted index or a modified capitalization-weighted index, the lesser of the five highest weighted component securities in the index or the highest weighted component securities in the index that in the aggregate represent at least 30% of the total number of stocks in the index each have had an average monthly trading volume of at least 1,000,000 shares over the past six months.

In the event a class of index options listed on NOM fails to satisfy the maintenance listing standards set forth herein, NOM shall not open for trading any additional series of options of that class unless such failure is determined by NOM not to be significant and the Commission concurs in that determination, or unless the continued listing of that class of index options has been approved by the Commission under Section 19(b)(2) of the Exchange Act.

(d) Notwithstanding paragraph (a) above, NOM may trade options on a Micro Narrow-Based security index pursuant to Rule 19b-4(e) of the 1934 Act, if each of the following condition is satisfied:

(1) The Index is a security index:

(i) that has 9 or fewer component securities; or

(ii) in which a component security comprises more than 30 percent of the index's weighting; or

(iii) in which the 5 highest weighted component securities in the aggregate comprise more

than 60 percent of the index's weighting; or

(iv) in which the lowest weighted component securities comprising, in the aggregate, 25 percent of the index's weighting have an aggregate dollar value of average daily trading volume of less than \$50,000,000 (or in the case of an index with 15 or more component securities, \$30,000,000) except that if there are two or more securities with equal weighting that could be included in the calculation of the lowest weighted component securities comprising, in the aggregate, 25 percent of the index's weighting, such securities shall be ranked from lowest to highest dollar value of average daily trading volume and shall be included in the calculation based on their ranking starting with the lowest ranked security;

(2) The index is capitalization-weighted, modified capitalization-weighted, price-weighted, share weighted, equal dollarweighted, approximate equal-dollar weighted, or modified equal-dollar weighted;

(i) For the purposes of this paragraph (d), an approximate equal-dollar weighted index is composed of one or more securities in which each component security will be weighted equally based on its market price on the index's selection date and the index must be reconstituted and rebalanced if the notional value of the largest component is at least twice the notional value of the smallest component for fifty percent or more of the trading days in the three months prior to December 31 of each year. For purposes of this provision the "notional value" is the market price of the component times the number of shares of the underlying component in the index. Reconstitution and rebalancing are also mandatory if the number of components in the index is greater than five at the time of rebalancing. NOM reserves the right to rebalance quarterly at its discretion.

(ii) For the purposes of this paragraph (d), a modified equal-dollar weighted index is an index in which each underlying component represents a pre-determined weighting percentage of the entire index. Each component is assigned a weight that takes into account the relative market capitalization of the securities comprising the index. A modified equal-dollar weighted index will be balanced quarterly.

(iii) For the purposes of this paragraph (d), a share-weighted index is calculated by multiplying the price of the component security by an adjustment factor. Adjustment factors are chosen to reflect the investment objective deemed appropriate by the designer of the index and will be published by the Exchange as part of the contract specifications. The value of the index is calculated by adding the weight of each component security and dividing the total by an index divisor, calculated to yield a benchmark index level as of a particular date. A share-weighted index is not adjusted to reflect changes in the number of outstanding shares of its components. A share-weighted Micro Narrow-Based index will not be rebalanced. If a share-weighted Micro Narrow-Based Index fails to meet the maintenance listing standards under Subsection (e) of this rule, NOM will restrict trading in existing option series to closing transactions and will not issue additional series for that index.

(iv) NOM may rebalance any Micro Narrow-Based index on an interim basis if warranted as a result of extraordinary changes in the relative values of the component securities. To the extent investors with open positions must rely upon the continuity of the options contract on the index, outstanding contracts are unaffected by rebalancings.

(3) Each component security in the index has a minimum market capitalization of at least \$75 million, except that each of the lowest weighted securities in the index that in the aggregate account for no more than 10% of the weight of the index may have a minimum market capitalization of only \$50 million;

(4) The average daily trading volume in each of the preceding six months for each component security in the index is at least 45,500 shares, except that each of the lowest weighted component securities in the index that in the aggregate account for no more than 10% of the weight of the index may have an average daily trading volume of only 22,750 shares for each

of the last six months;

(5) In a capitalization-weighted index, the lesser of: (1) the five highest weighted component securities in the index each have had an average daily trading volume of at least 90,000 shares over the past six months; or (2) the highest weighted component securities in the index that in the aggregate represent at least 30% of the total number of component securities in the index each have had an average daily trading volume of at least 90,000 shares over the past six months;

(6) Subject to subparagraphs (4) and (5) above, the component securities that account for at least 90% of the total index weight and at least 80% of the total number of component securities in the index must meet the requirements applicable to individual underlying securities;

(7)

(i) Each component security in the index is a "reported security" as defined in Rule 600 of Regulation NMS under the Exchange Act; and

(ii) Foreign securities or ADRs that are not subject to comprehensive surveillance sharing agreements do not represent more than 20% of the weight of the index;

(8) The current underlying index value will be reported at least once every fifteen seconds during the time the index options are traded on NOM;

(9) An equal dollar-weighted index will be rebalanced at least once every quarter;

(10) If the underlying index is maintained by a broker-dealer, the index is calculated by a third party who is not a broker-dealer, and the broker-dealer has in place an information barrier around its personnel who have access to information concerning changes in and adjustments to the index;

(11) Each component security in the index is registered pursuant to Section 12 of the Exchange Act; and

(12) Cash settled index options are designated as A.M.-settled options.

(e) The following maintenance listing standards shall apply to each class of index options originally listed pursuant to paragraph (d) above:

(1) The index meets the criteria of paragraph (d)(1) of this Rule;

(2) Subject to subparagraphs (9) and (10) below, the component securities that account for at least 90% of the total index weight and at least 80% of the total number of component securities in the index must meet the requirements of Section 3 of Chapter IV.

(3) Each component security in the index has a market capitalization of at least \$75 million, except that each of the lowest weighted component securities that in the aggregate account for no more than 10% of the weight of the index may have a market capitalization of only \$50 million;

(4) Each component security must be an "NMS stock" as defined in Rule 600 of Regulation NMS under the Exchange Act; and

(5) Foreign securities or ADRs thereon that are not subject to comprehensive surveillance sharing agreements do not represent more than 20% of the weight of the index;

(6) The current underlying index value will be reported at least once every fifteen seconds during the time the index options are traded on NOM;

(7) If the underlying index is maintained by a broker-dealer, the index is calculated by a third

party who is not a brokerdealer, and the broker-dealer has in place an information barrier around its personnel who have access to information concerning changes in and adjustments to the index;

- (8) The total number of component securities in the index may not increase or decrease by more than 33 1/3% from the number of component securities in the index at the time of its initial listing;
- (9) Trading volume of each component security in the index must be at least 500,000 shares for each of the last six months, except that for each of the lowest weighted component securities in the index that in the aggregate account for no more than 10% of the weight of the index, trading volume must be at least 400,000 shares for each of the last six months;
- (10) In a capitalization-weighted index and a modified capitalization-weighted index, the lesser of the five highest weighted component securities in the index or the highest weighted component securities in the index that in the aggregate represent at least 30% of the total number of stocks in the index each have had an average monthly trading volume of at least 1,000,000 shares over the past six months;
- (11) Each component security in the index is registered pursuant to Section 12 of the Exchange Act;
- (12) In an approximate equal-dollar weighted index, the index must be reconstituted and rebalanced if the notional value of the largest component is at least twice the notional volume of the smallest component for fifty percent or more of the trading days in the three months prior to December 31 of each year. For purposes of this provision the "notional value" is the market price of the component times the number of shares of the underlying component in the index. Reconstitution and rebalancing are also mandatory if the number of components in the index is greater than five at the time of rebalancing. NOM reserves the right to rebalance quarterly at its discretion;
- (13) In a modified equal-dollar weighted index NOM will rebalance the index quarterly;
- (14) In a share-weighted index, if a share-weighted Micro Narrow-Based Index fails to meet the maintenance listing standards under paragraph (e) of this Section NOM will not rebalance the index, will restrict trading in existing option series to closing transactions, and will not issue additional series for that index; and
- (15) In the event a class of index options listed on NOM fails to satisfy the maintenance listing standards set forth herein, NOM shall not open for trading any additional series of options of that class unless such failure is determined by NOM not to be significant and the Commission concurs in that determination, or unless the continued listing of that class of index options has been approved by the Commission under Section 19(b)(2) of the 1934 Act.

Hi Matt,

Thought you might be interested in this. It predicts negative impacts from DOL's forthcoming conflicts of interest rule. If you are inclined to look at it, I would be very interested to hear your reaction. Happy to discuss.

## **Expected Labor Department Fiduciary Regulation Could Cost Americans \$20-\$32 Billion in Retirement Savings**

**Rule change could reduce retirement security by causing more people to cash out their retirement accounts when they leave their jobs. Increased cash-outs caused by a loss of financial guidance could decrease retirement savings by as much as 40 percent for a**

April 9, 2014

WASHINGTON — American workers who cash out their retirement accounts when they leave their jobs are jeopardizing their future retirement security – a situation that could be exacerbated by a new regulation being considered by the U.S. Department of Labor (DOL) to expand fiduciary status. A study released today by Quantria Strategies reveals that the new regulation could reduce retirement savings by 20 to 40 percent for affected individuals, costing Americans between \$20 and \$32 billion in annual retirement savings.

The study found that those most likely to cash out their retirement savings are low-wage workers, those with low account balances, and workers under 30. High cash-out rates are also an issue for African-Americans and Hispanics.

The DOL is expected to issue a proposed fiduciary regulation later this year that would effectively prohibit many financial professionals from providing workers with education and guidance regarding the options available to them when they leave their jobs. Without this guidance, many workers may jeopardize their retirement security by cashing out their retirement savings at this critical point.

“Financial illiteracy increases Americans’ risk of bad decisions at what we know to be key ‘choke points’ in the retirement savings process,” according to Quantria Strategies. “A critical choke point is job-change time. The evidence reveals that when individuals -- particularly those with lower financial literacy -- have a financial professional’s help at job-change time, they are much more likely to do what benefits their long-term financial health: keep their money invested in a retirement savings vehicle rather than cash out and leave nothing for retirement.”

One company cited in the report found that speaking with a financial representative can make departing employees 3.2 times less likely to cash out their retirement savings, thus demonstrating the very substantial role that financial representatives can play in enhancing retirement security.

“Any regulation that limits an individual’s access to investment information when leaving a job could have a substantially adverse impact on retirement savings, reducing those savings by as much as 40 percent for affected individuals,” said Judy Xanthopoulos at Quantria Strategies. “When you’re looking at \$100,000 in retirement savings versus \$167,000, it makes a big difference.”

This report was commissioned by Davis & Harman LLP on behalf of a coalition of financial services organizations that provide retirement services to millions of Americans. Kent Mason of Davis & Harman is available to discuss the policy implications of this study, including with respect to the new fiduciary regulation being considered by the DOL: [kamason@davis-harman.com](mailto:kamason@davis-harman.com) and 202-662-2288.

Dear Joe and Anja,

Thanks very much for your note and the letter from February 2014. I read the latter with great interest.

We will find the study discussed by Commissioner Piowowar in a recent speech, and forward it to you within a few days. As you say, let's stay in touch on this.

Best wishes,  
Mark

**Subject:** UK RDR, etc.

Mark,

It was a pleasure meeting you yesterday. You had mentioned a study on availability of advice to small investors in the UK post-RDR. I would be very interested to see it. I mentioned that my agency has been in contact with the UK FCA about their experience so far under the RDR. I am attaching a letter that might be of interest to you. We have not shared it widely yet, so please keep it within SEC.

If as planned my agency soon issues a new fiduciary proposal, I expect questions might come your way about both the proposal itself and our impact analysis. As I mentioned yesterday, I have had the opportunity from time to time to consult with both Jennifer and Matt about our shared interest in this issue, and Matt currently has a copy of the confidential draft RIA.

I would be very happy to consult further with any or all of you, either before or after we issue a proposal. Unfortunately I will be mostly away from the office between now and the holidays. I have copied my Deputy, Anja Decressin, on this email, and you all should feel free to contact her during my absence.

My contact info and a link to info about my office appear below.

Thanks and best regards,  
Joe Piacentini

Sorry for the multiple e-mails!

The DOL's Chief Economist phoned me yesterday when he saw that many people from our working group had accepted the call for today. He is happy we are all participating but wanted to let me know that he really hopes the hour will be filled with insights from the academics. I think he is worried we might take over the call, but I told him that we viewed this as the DOL's call, and that we wouldn't hijack the meeting.

Thanks,

J.

This is excellent! So, if I have it right, pre-Dodd-Frank, approximately 10 percent of registrants with the SEC were new each year (1,100 approved registrations of approximately 10,754). Does that sound right?

Best,  
Dan

**Sent:** Friday, July 19, 2013 8:13 AM  
**To:** Puskin, Dan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

Apparently, we can only get approved registrations where the adviser remained registered at the end of the year.

This will cause the data will be a little bit off (very minor) for a few advisers that withdrew their registrations, reapplied for registration, and were approved in the same calendar year.

The withdrawals include advisers that switched to state registration.

Initial registrations include advisers that applied for registration but were never approved because they did not provide a complete application (or for other reasons).

Exempt Reporting Advisers or "ERAs" did not exist before 2012.

The data for calendar year 2012 is unusual because certain regulatory changes (i.e., the Dodd Frank Act) required that certain advisers switch to state registration, and also required unregistered advisers to private funds to register with the SEC.

The staff believes that the Commission historically has about 1,100 new registrations each year and about 700-800 withdrawals, and that the absolute growth of advisers is about 300 per year in a

normal year (300 more registrations approved than withdrawals).

|      | ADV-W withdrawals | Initial Registration Requests | Registration Approved | ERAs  |
|------|-------------------|-------------------------------|-----------------------|-------|
| 2012 | 3,048             | 2,121                         | 2,000                 | 2,330 |
| 2011 | 832               | 903                           | 806                   | N/A   |
| 2010 | 801               | 1,133                         | 1,036                 | N/A   |

Hi Bonnie,

Calendar year is good. Separate info on the exempt reporting advisers would be interesting to have. Number of new distinct registered investment advisers would be most useful. Not having the state info is okay-- just need some sense of what fraction of RIAs are new each year. Thanks again for all your help!

All the best,  
Dan

**To:** Puskin, Dan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

Is calendar year basis OK or do you need fiscal year?

Are you looking for the number of registration requests (which may not all have been approved), the number of approved registrations, or the actual increase in the number of registered investment advisers?

Do you also want numbers on the exempt reporting advisers (which just file info but are not approved or rejected)

Finally, my colleague wants to note that we don't have state data (smaller investment advisers do not need to register with the Commission, but may need to register with the various states).

**Subject:** RE: Broker-dealer numbers

Hi Dan!

When I asked my colleague in Investment Management, he indicated that there were 2,331 SEC exempt reporting advisers filing reports with the SEC as of January 1, 2013, and there were 17,259 state-registered investment advisers (699 state ERAs) as of January 1, 2013. There is some double counting of advisers as about 124 SEC-registered investment advisers are also state-registered investment advisers and 540 SEC exempt reporting advisers are also state exempt reporting advisers as of January 1, 2013.

Hi Dan!

Here is the only list we have. We receive this list monthly from FINRA, which maintains the Central Registration Depository system used by broker-dealers to file Forms BD. Forms BD are used to register not only with the SEC, but also with the exchanges and associations (e.g., FINRA or the Chicago Board Options Exchange ("CBOE")), and the states.

The reason there are over 6,000 rows here is because some broker-dealers are listed twice. I believe this is because each broker-dealer that is a member of more than one exchange or association is once for each exchange or association of which they are a member.

Yours,

Bonnie

Hi Dan!

I believe the answer to both of these questions is no. First, what is the definition of “discount broker?” A lot of people use that term, but I don’t believe there is one definition. Also, I don’t believe it is a question the Commission asks on any of its forms. I also don’t believe there is a way to easily isolate those BDs that might be associated with insurance companies. While the SEC probably receives information in this regard, it would not be in a format that would be searchable.

Sorry!

Bonnie

**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

The study you point to was issued by the Commission on January 22, 2011. On page 8 of this study, the Commission states, "Currently, the Commission oversees approximately 5,100 broker-dealers<sup>11</sup>..."

The corresponding footnote reads, "Unless otherwise specified, the statistics in Section II.A.2 are based on data derived from broker-dealers' responses to questions on the Uniform Application for Broker-Dealer Registration ("Form BD") reported through the Central Registration Depository ("CRD") as of September 30, 2010...."

I would highlight here that the text and footnote indicate that the number of broker-dealers is both "approximate," and based on data collected by the Commission "as of September 30, 2010."

In October, I provided you with data on the number of broker-dealers registered with the Commission as of the calendar years ending December, 2010 and December, 2011.

I hope this addresses your concerns.

**Subject:** RE: Broker-dealer numbers

Dear Dan,

Perhaps I am mistaken, but I didn't read Bonnie's message to mean that the BD number is overstated; I read it to mean that to get the data you were looking for you should reduce the number of Forms BD and Forms BDW filed to account for duplicate filings. I believe you can rely on her 4,813 number as the correct number of total number of BDs.

I'm not sure what the 5,100 number is based on. Would it be OK to wait until Bonnie returns on Monday and she can ask the person who gave her the other statistics? Perhaps that person knows.

Thanks,

Margaret

Dear Margaret,

In the statistics sent by Bonnie Gauch, she mentions that the BD number is overstated (see her message below). Is the 5,100 used in the Dodd-Frank report based on the 5,061 filers from 2010 or is it based on an adjustment to the 5,257 number in 2009.

Thanks for all your help!

Dear Ms. Smith,

The only number we need is the total number of broker-dealers. The 5,100 Broker-Dealers estimate in the Dodd-Frank report is based on 2009 numbers. If there was an updated estimate for the total number of broker dealers, that would be very helpful. Here is a link to the version of the report we've been looking at:

[www.sec.gov/news/studies/2011/913studyfinal.pdf](http://www.sec.gov/news/studies/2011/913studyfinal.pdf)

All the best,  
Daniel

**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Thank you so much for your help in October. The statistics on new broker-dealers have been very useful! I now have a follow up question. In SEC's Dodd-Frank report (*Study on Investment Advisers and Broker-Dealers*), there is a passage that reads as follows:

*“Broker-Dealers: The Commission and FINRA oversee approximately 5,100 broker-dealers. As of the end of 2009, FINRA-registered broker-dealers held over 109 million retail and institutional accounts. Approximately 18% of FINRA-registered broker-dealers also are registered as investment advisers with the Commission or a state. Most broker-dealers receive transaction-based compensation.”*

Is it possible to get more updated numbers for the total number of broker-dealers based on 2011 or 2012 submissions?

Happy Holidays,  
Daniel

**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337

Forms BD filed in the calendar year ending 12/31/2010 - 285

Forms BD filed in the calendar year ending 12/31/2011 - 216

Forms BDW filed in the calendar year ending 12/31/2009 - 285

Forms BDW filed in the calendar year ending 12/31/2010 - 549

Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

**Sent:** Friday, July 19, 2013 8:13 AM  
**To:** Puskin, Dan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

Apparently, we can only get approved registrations where the adviser remained registered at the end of the year.

This will cause the data will be a little bit off (very minor) for a few advisers that withdrew their registrations, reapplied for registration, and were approved in the same calendar year.

The withdrawals include advisers that switched to state registration.

Initial registrations include advisers that applied for registration but were never approved because they did not provide a complete application (or for other reasons).

Exempt Reporting Advisers or "ERAs" did not exist before 2012.

The data for calendar year 2012 is unusual because certain regulatory changes (i.e., the Dodd Frank Act) required that certain advisers switch to state registration, and also required unregistered advisers to private funds to register with the SEC.

The staff believes that the Commission historically has about 1,100 new registrations each year and about 700-800 withdrawals, and that the absolute growth of advisers is about 300 per year in a normal year (300 more registrations approved than withdrawals).

|      | ADV-W withdrawals | Initial Registration Requests | Registration Approved | ERAs  |
|------|-------------------|-------------------------------|-----------------------|-------|
| 2012 | 3,048             | 2,121                         | 2,000                 | 2,330 |
| 2011 | 832               | 903                           | 806                   | N/A   |
| 2010 | 801               | 1,133                         | 1,036                 | N/A   |

Hi Dan!

Is calendar year basis OK or do you need fiscal year?

Are you looking for the number of registration requests (which may not all have been approved), the number of approved registrations, or the actual increase in the number of registered investment advisers?

Do you also want numbers on the exempt reporting advisers (which just file info but are not approved or rejected)

Finally, my colleague wants to note that we don't have state data (smaller investment advisers do not need to register with the Commission, but may need to register with the various states).

**To:** Puskin, Dan - EBSA  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

The study you point to was issued by the Commission on January 22, 2011. On page 8 of this study, the Commission states, "Currently, the Commission oversees approximately 5,100 broker-dealers<sup>11</sup>..."

The corresponding footnote reads, "Unless otherwise specified, the statistics in Section II.A.2 are based on data derived from broker-dealers' responses to questions on the Uniform Application for Broker-Dealer Registration ("Form BD") reported through the Central Registration Depository ("CRD") as of September 30, 2010...."

I would highlight here that the text and footnote indicate that the number of broker-dealers is both "approximate," and based on data collected by the Commission "as of September 30, 2010."

In October, I provided you with data on the number of broker-dealers registered with the Commission as of the calendar years ending December, 2010 and December, 2011.

I hope this addresses your concerns.

**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Dear Dan,

Perhaps I am mistaken, but I didn't read Bonnie's message to mean that the BD number is overstated; I read it to mean that to get the data you were looking for you should reduce the number of Forms BD and Forms BDW filed to account for duplicate filings. I believe you can rely on her 4,813 number as the correct number of total number of BDs.

I'm not sure what the 5,100 number is based on. Would it be OK to wait until Bonnie returns on Monday and she can ask the person who gave her the other statistics? Perhaps that person knows.

Thanks,

Margaret

**Subject:** RE: Broker-dealer numbers

Dear Ms. Smith,

The only number we need is the total number of broker-dealers. The 5,100 Broker-Dealers estimate in the Dodd-Frank report is based on 2009 numbers. If there was an updated estimate for the total number of broker dealers, that would be very helpful. Here is a link to the version of the report we've been looking at:

[www.sec.gov/news/studies/2011/913studyfinal.pdf](http://www.sec.gov/news/studies/2011/913studyfinal.pdf)

All the best,

Daniel

**To:** TradingAndMarkets  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Thank you so much for your help in October. The statistics on new broker-dealers have been very useful! I now have a follow up question. In SEC's Dodd-Frank report (*Study on Investment Advisers and Broker-Dealers*), there is a passage that reads as follows:

*“Broker-Dealers: The Commission and FINRA oversee approximately 5,100 broker-dealers. As of the end of 2009, FINRA-registered broker-dealers held over 109 million retail and institutional accounts. Approximately 18% of FINRA-registered broker-dealers also are registered as investment advisers with the Commission or a state. Most broker-dealers receive transaction-based compensation.”*

Is it possible to get more updated numbers for the total number of broker-dealers based on 2011 or 2012 submissions?

Happy Holidays,  
Daniel

**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337

Forms BD filed in the calendar year ending 12/31/2010 - 285

Forms BD filed in the calendar year ending 12/31/2011 - 216

Forms BDW filed in the calendar year ending 12/31/2009 - 285

Forms BDW filed in the calendar year ending 12/31/2010 - 549

Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

This is excellent! So, if I have it right, pre-Dodd-Frank, approximately 10 percent of registrants with the SEC were new each year (1,100 approved registrations of approximately 10,754). Does that sound right?

Best,  
Dan

**Sent:** Friday, July 19, 2013 8:13 AM  
**To:** Puskin, Dan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

Apparently, we can only get approved registrations where the adviser remained registered at the end of the year.

This will cause the data will be a little bit off (very minor) for a few advisers that withdrew their registrations, reapplied for registration, and were approved in the same calendar year.

The withdrawals include advisers that switched to state registration.

Initial registrations include advisers that applied for registration but were never approved because they did not provide a complete application (or for other reasons).

Exempt Reporting Advisers or "ERAs" did not exist before 2012.

The data for calendar year 2012 is unusual because certain regulatory changes (i.e., the Dodd Frank Act) required that certain advisers switch to state registration, and also required unregistered advisers to private funds to register with the SEC.

The staff believes that the Commission historically has about 1,100 new registrations each year and about 700-800 withdrawals, and that the absolute growth of advisers is about 300 per year in a normal year (300 more registrations approved than withdrawals).

|      | ADV-W withdrawals | Initial Registration Requests | Registration Approved | ERAs  |
|------|-------------------|-------------------------------|-----------------------|-------|
| 2012 | 3,048             | 2,121                         | 2,000                 | 2,330 |
| 2011 | 832               | 903                           | 806                   | N/A   |
| 2010 | 801               | 1,133                         | 1,036                 | N/A   |

Hi Dan!

Is calendar year basis OK or do you need fiscal year?  
Are you looking for the number of registration requests (which may not all have been approved), the number of approved registrations, or the actual increase in the number of registered investment advisers?  
Do you also want numbers on the exempt reporting advisers (which just file info but are not approved or rejected)  
Finally, my colleague wants to note that we don't have state data (smaller investment advisers do not need to register with the Commission, but may need to register with the various states).

Hi Dan!

Here is the only list we have. We receive this list monthly from FINRA, which maintains the Central Registration Depository system used by broker-dealers to file Forms BD. Forms BD are used to register not only with the SEC, but also with the exchanges and associations (e.g., FINRA or the Chicago Board Options Exchange ("CBOE")), and the states.

The reason there are over 6,000 rows here is because some broker-dealers are listed twice. I believe this is because each broker-dealer that is a member of more than one exchange or association is once for each exchange or association of which they are a member.

Yours,

Bonnie

Hi Dan!

I believe the answer to both of these questions is no.  
First, what is the definition of "discount broker?" A lot of people use that term, but I don't believe there is one definition. Also, I don't believe it is a question the Commission asks on any of its forms. I also don't believe there is a way to easily isolate those BDs that might be associated with insurance companies. While the SEC probably receives information in this regard, it would not be in a format that would be searchable.

Sorry!

Dear Daniel,

Thank you for the clarification. There were 4,813 broker-dealers registered with the Commission as of 12/31/2011. I don't know when the 2012 number will be available; I believe the number is reported annually, but I don't know when.

Please let us know if we can help with anything else!

Margaret

**Subject:** RE: Broker-dealer numbers

Dear Ms. Smith,

The only number we need is the total number of broker-dealers. The 5,100 Broker-Dealers estimate in the Dodd-Frank report is based on 2009 numbers. If there was an updated estimate for the total number of broker dealers, that would be very helpful. Here is a link to the version of the report we've been looking at:

[www.sec.gov/news/studies/2011/913studyfinal.pdf](http://www.sec.gov/news/studies/2011/913studyfinal.pdf)

All the best,  
Daniel

**To:** TradingAndMarkets  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Thank you so much for your help in October. The statistics on new broker-dealers have been very useful! I now have a follow up question. In SEC's Dodd-Frank report (*Study on Investment Advisers and Broker-Dealers*), there is a passage that reads as follows:

*“Broker-Dealers: The Commission and FINRA oversee approximately 5,100 broker-dealers. As of the end of 2009, FINRA-registered broker-dealers held over 109 million retail and institutional accounts. Approximately 18% of FINRA-registered broker-dealers also are registered as investment advisers with the Commission or a state. Most broker-dealers receive transaction-based compensation.”*

Is it possible to get more updated numbers for the total number of broker-dealers based on 2011 or 2012 submissions?

Happy Holidays,  
Daniel

**Sent:** Friday, October 05, 2012 4:00 PM  
**To:** Puskin, Dan - EBSA  
**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337  
Forms BD filed in the calendar year ending 12/31/2010 - 285  
Forms BD filed in the calendar year ending 12/31/2011 - 216

Forms BDW filed in the calendar year ending 12/31/2009 - 285

Forms BDW filed in the calendar year ending 12/31/2010 - 549

Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

Hi Dan!

Apparently, we can only get approved registrations where the adviser remained registered at the end of the year.

This will cause the data will be a little bit off (very minor) for a few advisers that withdrew their registrations, reapplied for registration, and were approved in the same calendar year.

The withdrawals include advisers that switched to state registration.

Initial registrations include advisers that applied for registration but were never approved because they did not provide a complete application (or for other reasons).

Exempt Reporting Advisers or "ERAs" did not exist before 2012.

The data for calendar year 2012 is unusual because certain regulatory changes (i.e., the Dodd Frank Act) required that certain advisers switch to state registration, and also required unregistered advisers to private funds to register with the SEC.

The staff believes that the Commission historically has about 1,100 new registrations each year and about 700-800 withdrawals, and that the absolute growth of advisers is about 300 per year in a normal year (300 more registrations approved than withdrawals).

|      | ADV-W withdrawals | Initial Registration Requests | Registration Approved | ERAs  |
|------|-------------------|-------------------------------|-----------------------|-------|
| 2012 | 3,048             | 2,121                         | 2,000                 | 2,330 |
| 2011 | 832               | 903                           | 806                   | N/A   |
| 2010 | 801               | 1,133                         | 1,036                 | N/A   |

Hi Dan!

Is calendar year basis OK or do you need fiscal year?

Are you looking for the number of registration requests (which may not all have been approved), the number of approved registrations, or the actual increase in the number of registered investment advisers?

Do you also want numbers on the exempt reporting advisers (which just file info but are not approved or rejected)

Finally, my colleague wants to note that we don't have state data (smaller investment advisers do not need to register with the Commission, but may need to register with the various states).

Hi Dan!

When I asked my colleague in Investment Management, he indicated that there were 2,331 SEC exempt reporting advisers filing reports with the SEC as of January 1, 2013, and there were 17,259 state-registered investment advisers (699 state ERAs) as of January 1, 2013. There is some double counting of advisers as about 124 SEC-registered investment advisers are also state-registered investment advisers and 540 SEC exempt reporting advisers are also state exempt reporting advisers as of January 1, 2013.

Hi Dan!

Here is the only list we have. We receive this list monthly from FINRA, which maintains the Central Registration Depository system used by broker-dealers to file Forms BD. Forms BD are used to register not only with the SEC, but also with the exchanges and associations (e.g., FINRA or the Chicago Board Options Exchange ("CBOE")), and the states.

The reason there are over 6,000 rows here is because some broker-dealers are listed twice. I believe this is because each broker-dealer that is a member of more than one exchange or association is once for each exchange or association of which they are a member.

Yours,

Bonnie

Hi Dan!

I believe the answer to both of these questions is no. First, what is the definition of "discount broker?" A lot of people use that term, but I don't believe there is one definition. Also, I don't believe it is a question the Commission asks on any of its forms. I also don't believe there is a way to easily isolate those BDs that might be associated with insurance companies. While the SEC probably receives information in this regard, it would not be in a format that would be searchable.

Sorry!

Bonnie

**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

The study you point to was issued by the Commission on January 22, 2011. On page 8 of this study, the Commission states, "Currently, the Commission oversees approximately 5,100 broker-dealers<sup>11</sup>..."

The corresponding footnote reads, "Unless otherwise specified, the statistics in Section II.A.2 are based on data derived from broker-dealers' responses to questions on the Uniform Application for Broker-Dealer Registration ("Form BD") reported through the Central Registration Depository ("CRD") as of September 30, 2010...."

I would highlight here that the text and footnote indicate that the number of broker-dealers is both "approximate," and based on data collected by the Commission "as of September 30, 2010."

In October, I provided you with data on the number of broker-dealers registered with the Commission as of the calendar years ending December, 2010 and December, 2011.

I hope this addresses your concerns.

**Subject:** RE: Broker-dealer numbers

Dear Dan,

Perhaps I am mistaken, but I didn't read Bonnie's message to mean that the BD number is overstated; I read it to mean that to get the data you were looking for you should reduce the number of Forms BD and Forms BDW filed to account for duplicate filings. I believe you can rely on her 4,813 number as the correct number of total number of BDs.

I'm not sure what the 5,100 number is based on. Would it be OK to wait until Bonnie returns on Monday and she can ask the person who gave her the other statistics? Perhaps that person knows.

Thanks,

Margaret

**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337

Forms BD filed in the calendar year ending 12/31/2010 - 285

Forms BD filed in the calendar year ending 12/31/2011 - 216

Forms BDW filed in the calendar year ending 12/31/2009 - 285

Forms BDW filed in the calendar year ending 12/31/2010 - 549

Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061

and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

Hi Dan!

When I asked my colleague in Investment Management, he indicated that there were 2,331 SEC exempt reporting advisers filing reports with the SEC as of January 1, 2013, and there were 17,259 state-registered investment advisers (699 state ERAs) as of January 1, 2013. There is some double counting of advisers as about 124 SEC-registered investment advisers are also state-registered investment advisers and 540 SEC exempt reporting advisers are also state exempt reporting advisers as of January 1, 2013.

**Subject:** RE: Broker-dealer numbers

Hi Dan!

Here is the only list we have. We receive this list monthly from FINRA, which maintains the Central Registration Depository system used by broker-dealers to file Forms BD. Forms BD are used to register not only with the SEC, but also with the exchanges and associations (e.g., FINRA or the Chicago Board Options Exchange ("CBOE")), and the states.

The reason there are over 6,000 rows here is because some broker-dealers are listed twice. I believe this is because each broker-dealer that is a member of more than one exchange or association is once for each exchange or association of which they are a member.

Yours,

Bonnie

Hi Dan!

I believe the answer to both of these questions is no.

First, what is the definition of "discount broker?" A lot of people use that term, but I don't believe there is one definition. Also, I don't believe it is a question the Commission asks on any of its forms. I also don't believe there is a way to easily isolate those BDs that might be associated with insurance

companies. While the SEC probably receives information in this regard, it would not be in a format that would be searchable.

Sorry!

Bonnie

**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

The study you point to was issued by the Commission on January 22, 2011. On page 8 of this study, the Commission states, "Currently, the Commission oversees approximately 5,100 broker-dealers<sup>11</sup>..."

The corresponding footnote reads, "Unless otherwise specified, the statistics in Section II.A.2 are based on data derived from broker-dealers' responses to questions on the Uniform Application for Broker-Dealer Registration ("Form BD") reported through the Central Registration Depository ("CRD") as of September 30, 2010...."

I would highlight here that the text and footnote indicate that the number of broker-dealers is both "approximate," and based on data collected by the Commission "as of September 30, 2010."

In October, I provided you with data on the number of broker-dealers registered with the Commission as of the calendar years ending December, 2010 and December, 2011.

I hope this addresses your concerns.

**Subject:** RE: Broker-dealer numbers

Dear Dan,

Perhaps I am mistaken, but I didn't read Bonnie's message to mean that the BD number is overstated; I read it to mean that to get the data you were looking for you should reduce the number of Forms BD and Forms BDW filed to account for duplicate filings. I believe you can rely on her 4,813 number as the correct number of total number of BDs.

I'm not sure what the 5,100 number is based on. Would it be OK to wait until Bonnie returns on Monday and she can ask the person who gave her the other statistics? Perhaps that person knows.

Thanks,

Margaret

Dear Margaret,

In the statistics sent by Bonnie Gauch, she mentions that the BD number is overstated (see her message below). Is the 5,100 used in the Dodd-Frank report based on the 5,061 filers from 2010 or is it based on an adjustment to the 5,257 number in 2009.

Thanks for all your help!

Dear Ms. Smith,

The only number we need is the total number of broker-dealers. The 5,100 Broker-Dealers estimate in the Dodd-Frank report is based on 2009 numbers. If there was an updated estimate for the total number of broker dealers, that would be very helpful. Here is a link to the version of the report we've been looking at:

[www.sec.gov/news/studies/2011/913studyfinal.pdf](http://www.sec.gov/news/studies/2011/913studyfinal.pdf)

All the best,  
Daniel

**Sent:** Thursday, December 27, 2012 4:58 PM  
**To:** TradingAndMarkets  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Thank you so much for your help in October. The statistics on new broker-dealers have been very useful! I now have a follow up question. In SEC's Dodd-Frank report (*Study on Investment Advisers and Broker-Dealers*), there is a passage that reads as follows:

*“Broker-Dealers: The Commission and FINRA oversee approximately 5,100 broker-dealers. As of the end of 2009, FINRA-registered broker-dealers held over 109 million retail and institutional accounts. Approximately 18% of FINRA-registered broker-dealers also are registered as investment advisers with the Commission or a state. Most broker-dealers receive transaction-based compensation.”*

Is it possible to get more updated numbers for the total number of broker-dealers based on 2011 or 2012 submissions?

Happy Holidays,  
Daniel

Daniel Puskin, PhD

**Sent:** Friday, October 05, 2012 4:00 PM  
**To:** Puskin, Dan - EBSA  
**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw

from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337

Forms BD filed in the calendar year ending 12/31/2010 - 285

Forms BD filed in the calendar year ending 12/31/2011 - 216

Forms BDW filed in the calendar year ending 12/31/2009 - 285

Forms BDW filed in the calendar year ending 12/31/2010 - 549

Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

Hi Dan!

Is calendar year basis OK or do you need fiscal year?

Are you looking for the number of registration requests (which may not all have been approved), the number of approved registrations, or the actual increase in the number of registered investment advisers?

Do you also want numbers on the exempt reporting advisers (which just file info but are not approved or rejected)

Finally, my colleague wants to note that we don't have state data (smaller investment advisers do not need to register with the Commission, but may need to register with the various states).

Hi Bonnie,

Thank you so much for all your help! If we wanted to state the total number of broker-dealers in the United States that have commission based arrangements, would 5,100 be a good estimate, or are we missing some set of BDs that is not included in that statistic?

Best,

Dan

**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

The study you point to was issued by the Commission on January 22, 2011. On page 8 of this study, the Commission states, "Currently, the Commission oversees approximately 5,100 broker-dealers<sup>11</sup>..."

The corresponding footnote reads, "Unless otherwise specified, the statistics in Section II.A.2 are based on data derived from broker-dealers' responses to questions on the Uniform Application for Broker-Dealer Registration ("Form BD") reported through the Central Registration Depository

("CRD") as of September 30, 2010...."

I would highlight here that the text and footnote indicate that the number of broker-dealers is both "approximate," and based on data collected by the Commission "as of September 30, 2010."

In October, I provided you with data on the number of broker-dealers registered with the Commission as of the calendar years ending December, 2010 and December, 2011.

I hope this addresses your concerns.

**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Dear Dan,

Perhaps I am mistaken, but I didn't read Bonnie's message to mean that the BD number is overstated; I read it to mean that to get the data you were looking for you should reduce the number of Forms BD and Forms BDW filed to account for duplicate filings. I believe you can rely on her 4,813 number as the correct number of total number of BDs.

I'm not sure what the 5,100 number is based on. Would it be OK to wait until Bonnie returns on Monday and she can ask the person who gave her the other statistics? Perhaps that person knows.

Thanks,

Margaret

Dear Ms. Smith,

The only number we need is the total number of broker-dealers. The 5,100 Broker-Dealers estimate in the Dodd-Frank report is based on 2009 numbers. If there was an updated estimate for the total number of broker dealers, that would be very helpful. Here is a link to the version of the report we've been looking at:

[www.sec.gov/news/studies/2011/913studyfinal.pdf](http://www.sec.gov/news/studies/2011/913studyfinal.pdf)

All the best,  
Daniel

**To:** TradingAndMarkets  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Thank you so much for your help in October. The statistics on new broker-dealers have been very useful! I now have a follow up question. In SEC's Dodd-Frank report (*Study on Investment Advisers*

and Broker-Dealers), there is a passage that reads as follows:

*“Broker-Dealers: The Commission and FINRA oversee approximately 5,100 broker-dealers. As of the end of 2009, FINRA-registered broker-dealers held over 109 million retail and institutional accounts. Approximately 18% of FINRA-registered broker-dealers also are registered as investment advisers with the Commission or a state. Most broker-dealers receive transaction-based compensation.”*

Is it possible to get more updated numbers for the total number of broker-dealers based on 2011 or 2012 submissions?

Happy Holidays,  
Daniel

**Sent:** Friday, October 05, 2012 4:00 PM  
**To:** Puskin, Dan - EBSA  
**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337

Forms BD filed in the calendar year ending 12/31/2010 - 285

Forms BD filed in the calendar year ending 12/31/2011 - 216

Forms BDW filed in the calendar year ending 12/31/2009 - 285

Forms BDW filed in the calendar year ending 12/31/2010 - 549

Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you

the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

**Subject:** RE: Broker-dealer numbers

Hi Dan!

When I asked my colleague in Investment Management, he indicated that there were 2,331 SEC exempt reporting advisers filing reports with the SEC as of January 1, 2013, and there were 17,259 state-registered investment advisers (699 state ERAs) as of January 1, 2013. There is some double counting of advisers as about 124 SEC-registered investment advisers are also state-registered investment advisers and 540 SEC exempt reporting advisers are also state exempt reporting advisers as of January 1, 2013.

Hi Dan!

Here is the only list we have. We receive this list monthly from FINRA, which maintains the Central Registration Depository system used by broker-dealers to file Forms BD. Forms BD are used to register not only with the SEC, but also with the exchanges and associations (e.g., FINRA or the Chicago Board Options Exchange ("CBOE")), and the states.

The reason there are over 6,000 rows here is because some broker-dealers are listed twice. I believe this is because each broker-dealer that is a member of more than one exchange or association is once for each exchange or association of which they are a member.

Yours,

Bonnie

Hi Dan!

I believe the answer to both of these questions is no. First, what is the definition of "discount broker?" A lot of people use that term, but I don't believe there is one definition. Also, I don't believe it is a question the Commission asks on any of its forms. I also don't believe there is a way to easily isolate those BDs that might be associated with insurance companies. While the SEC probably receives information in this regard, it would not be in a format that would be searchable.

Sorry!

Bonnie

---

Hi Dan!

When I asked my colleague in Investment Management, he indicated that there were 2,331 SEC exempt reporting advisers filing reports with the SEC as of January 1, 2013, and there were 17,259 state-registered investment advisers (699 state ERAs) as of January 1, 2013. There is some double counting of advisers as about 124 SEC-registered investment advisers are also state-registered investment advisers and 540 SEC exempt reporting advisers are also state exempt reporting advisers as of January 1, 2013.

Bonnie

Hi Dan!

Here is the only list we have. We receive this list monthly from FINRA, which maintains the Central Registration Depository system used by broker-dealers to file Forms BD. Forms BD are used to register not only with the SEC, but also with the exchanges and associations (e.g., FINRA or the Chicago Board Options Exchange ("CBOE")), and the states.

The reason there are over 6,000 rows here is because some broker-dealers are listed twice. I believe this is because each broker-dealer that is a member of more than one exchange or association is once for each exchange or association of which they are a member.

Yours,

Bonnie

**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

The study you point to was issued by the Commission on January 22, 2011. On page 8 of this study, the Commission states, "Currently, the Commission oversees approximately 5,100 broker-dealers<sup>11</sup>..."

The corresponding footnote reads, "Unless otherwise specified, the statistics in Section II.A.2 are based on data derived from broker-dealers' responses to questions on the Uniform Application for Broker-Dealer Registration ("Form BD") reported through the Central Registration Depository ("CRD") as of September 30, 2010...."

I would highlight here that the text and footnote indicate that the number of broker-dealers is both "approximate," and based on data collected by the Commission "as of September 30, 2010."

In October, I provided you with data on the number of broker-dealers registered with the Commission as of the calendar years ending December, 2010 and December, 2011.

I hope this addresses your concerns.

**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Dear Dan,

Perhaps I am mistaken, but I didn't read Bonnie's message to mean that the BD number is overstated; I read it to mean that to get the data you were looking for you should reduce the number of Forms BD and Forms BDW filed to account for duplicate filings. I believe you can rely on her 4,813 number as the correct number of total number of BDs.

I'm not sure what the 5,100 number is based on. Would it be OK to wait until Bonnie returns on Monday and she can ask the person who gave her the other statistics? Perhaps that person knows.

Thanks,

Margaret

Dear Ms. Smith,

The only number we need is the total number of broker-dealers. The 5,100 Broker-Dealers estimate in the Dodd-Frank report is based on 2009 numbers. If there was an updated estimate for the total number of broker dealers, that would be very helpful. Here is a link to the version of the report we've been looking at:

[www.sec.gov/news/studies/2011/913studyfinal.pdf](http://www.sec.gov/news/studies/2011/913studyfinal.pdf)

All the best,  
Daniel

**To:** TradingAndMarkets

**Cc:** Beckmann, Allan - EBSA

**Subject:** RE: Broker-dealer numbers

Thank you so much for your help in October. The statistics on new broker-dealers have been very useful! I now have a follow up question. In SEC's Dodd-Frank report (*Study on Investment Advisers and Broker-Dealers*), there is a passage that reads as follows:

*"Broker-Dealers: The Commission and FINRA oversee approximately 5,100 broker-dealers. As of the end of 2009, FINRA-registered broker-dealers held over 109 million retail and institutional accounts. Approximately 18% of FINRA-registered broker-dealers also are registered as investment advisers with the Commission or a state. Most broker-dealers receive transaction-based compensation."*

Is it possible to get more updated numbers for the total number of broker-dealers based on 2011 or 2012 submissions?

Happy Holidays,

Daniel

**To:** Puskin, Dan - EBSA

**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337

Forms BD filed in the calendar year ending 12/31/2010 - 285

Forms BD filed in the calendar year ending 12/31/2011 - 216

Forms BDW filed in the calendar year ending 12/31/2009 - 285

Forms BDW filed in the calendar year ending 12/31/2010 - 549

Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

**To:** Puskin, Dan - EBSA; TradingAndMarkets  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Dear Dan,

Perhaps I am mistaken, but I didn't read Bonnie's message to mean that the BD number is overstated; I read it to mean that to get the data you were looking for you should reduce the number of Forms BD and Forms BDW filed to account for duplicate filings. I believe you can rely on her 4,813 number as the correct number of total number of BDs.

I'm not sure what the 5,100 number is based on. Would it be OK to wait until Bonnie returns on Monday and she can ask the person who gave her the other statistics? Perhaps that person knows.

Thanks,

Margaret

**Subject:** RE: Broker-dealer numbers

Dear Margaret,

In the statistics sent by Bonnie Gauch, she mentions that the BD number is overstated (see her message below). Is the 5,100 used in the Dodd-Frank report based on the 5,061 filers from 2010 or is it based on an adjustment to the 5,257 number in 2009.

Thanks for all your help!  
Dan

Dear Ms. Smith,

The only number we need is the total number of broker-dealers. The 5,100 Broker-Dealers estimate in the Dodd-Frank report is based on 2009 numbers. If there was an updated estimate for the total number of broker dealers, that would be very helpful. Here is a link to the version of the report we've been looking at:

[www.sec.gov/news/studies/2011/913studyfinal.pdf](http://www.sec.gov/news/studies/2011/913studyfinal.pdf)

All the best,  
Daniel

**Sent:** Thursday, December 27, 2012 4:58 PM  
**To:** TradingAndMarkets  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Thank you so much for your help in October. The statistics on new broker-dealers have been very useful! I now have a follow up question. In SEC's Dodd-Frank report (*Study on Investment Advisers and Broker-Dealers*), there is a passage that reads as follows:

**“Broker-Dealers:** The Commission and FINRA oversee approximately 5,100 broker-dealers. As of the end of 2009, FINRA-registered broker-dealers held over 109 million retail and institutional accounts. Approximately 18% of FINRA-registered broker-dealers also are registered as investment advisers with the Commission or a state. Most broker-dealers receive transaction-based compensation.”

Is it possible to get more updated numbers for the total number of broker-dealers based on 2011 or 2012 submissions?

Happy Holidays,  
Daniel

**Sent:** Friday, October 05, 2012 4:00 PM  
**To:** Puskin, Dan - EBSA  
**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337

Forms BD filed in the calendar year ending 12/31/2010 - 285

Forms BD filed in the calendar year ending 12/31/2011 - 216

Forms BDW filed in the calendar year ending 12/31/2009 - 285

Forms BDW filed in the calendar year ending 12/31/2010 - 549

Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started

business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

**Subject:** RE: Broker-dealer numbers

Hi Dan!

Here is the only list we have. We receive this list monthly from FINRA, which maintains the Central Registration Depository system used by broker-dealers to file Forms BD. Forms BD are used to register not only with the SEC, but also with the exchanges and associations (e.g., FINRA or the Chicago Board Options Exchange ("CBOE")), and the states.

The reason there are over 6,000 rows here is because some broker-dealers are listed twice. I believe this is because each broker-dealer that is a member of more than one exchange or association is once for each exchange or association of which they are a member.

Yours,

Bonnie

**Subject:** RE: Broker-dealer numbers

Hi Dan!

I believe the answer to both of these questions is no. First, what is the definition of "discount broker?" A lot of people use that term, but I don't believe there is one definition. Also, I don't believe it is a question the Commission asks on any of its forms. I also don't believe there is a way to easily isolate those BDs that might be associated with insurance companies. While the SEC probably receives information in this regard, it would not be in a format that would be searchable.

Sorry!

Bonnie

**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

The study you point to was issued by the Commission on January 22, 2011. On page 8 of this study, the Commission states, "Currently, the Commission oversees approximately 5,100 broker-dealers<sup>11</sup>..."

The corresponding footnote reads, "Unless otherwise specified, the statistics in Section II.A.2 are based on data derived from broker-dealers' responses to questions on the Uniform Application for Broker-Dealer Registration ("Form BD") reported through the Central Registration Depository ("CRD") as of September 30, 2010...."

I would highlight here that the text and footnote indicate that the number of broker-dealers is both "approximate," and based on data collected by the Commission "as of September 30, 2010."

In October, I provided you with data on the number of broker-dealers registered with the Commission as of the calendar years ending December, 2010 and December, 2011.

I hope this addresses your concerns.

**Sent:** Friday, October 05, 2012 4:00 PM  
**To:** Puskin, Dan - EBSA  
**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337

Forms BD filed in the calendar year ending 12/31/2010 - 285

Forms BD filed in the calendar year ending 12/31/2011 - 216

Forms BDW filed in the calendar year ending 12/31/2009 - 285

Forms BDW filed in the calendar year ending 12/31/2010 - 549

Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

**To:** Puskin, Dan - EBSA; TradingAndMarkets  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

I believe the answer to both of these questions is no. First, what is the definition of "discount broker?" A lot of people use that term, but I don't believe there is one definition. Also, I don't believe it is a question the Commission asks on any of its forms. I also don't believe there is a way to easily isolate those BDs that might be associated with insurance companies. While the SEC probably receives information in this regard, it would not be in a format that would be searchable.

Sorry!

Bonnie

**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

The study you point to was issued by the Commission on January 22, 2011. On page 8 of this study, the Commission states, "Currently, the Commission oversees approximately 5,100 broker-dealers<sup>11</sup>..."

The corresponding footnote reads, "Unless otherwise specified, the statistics in Section II.A.2 are based on data derived from broker-dealers' responses to questions on the Uniform Application for Broker-Dealer Registration ("Form BD") reported through the Central Registration Depository ("CRD") as of September 30, 2010..."

I would highlight here that the text and footnote indicate that the number of broker-dealers is both "approximate," and based on data collected by the Commission "as of September 30, 2010."

In October, I provided you with data on the number of broker-dealers registered with the Commission as of the calendar years ending December, 2010 and December, 2011.

I hope this addresses your concerns.

**To:** TradingAndMarkets  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Thank you so much for your help in October. The statistics on new broker-dealers have been very useful! I now have a follow up question. In SEC's Dodd-Frank report (*Study on Investment Advisers and Broker-Dealers*), there is a passage that reads as follows:

*"Broker-Dealers: The Commission and FINRA oversee approximately 5,100 broker-dealers. As of the end of 2009, FINRA-registered broker-dealers held over 109 million retail and institutional accounts. Approximately 18% of FINRA-registered broker-dealers also are registered as investment advisers with the Commission or a state. Most broker-dealers receive transaction-based compensation."*

Is it possible to get more updated numbers for the total number of broker-dealers based on 2011 or

2012 submissions?

Happy Holidays,  
Daniel

**Sent:** Friday, October 05, 2012 4:00 PM  
**To:** Puskin, Dan - EBSA  
**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337

Forms BD filed in the calendar year ending 12/31/2010 - 285

Forms BD filed in the calendar year ending 12/31/2011 - 216

Forms BDW filed in the calendar year ending 12/31/2009 - 285

Forms BDW filed in the calendar year ending 12/31/2010 - 549

Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

Hi Dan!

Here is the only list we have. We receive this list monthly from FINRA, which maintains the Central Registration Depository system used by broker-dealers to file Forms BD. Forms BD are used to register not only with the SEC, but also with the exchanges and associations (e.g., FINRA or the Chicago Board Options Exchange ("CBOE")), and the states.

The reason there are over 6,000 rows here is because some broker-dealers are listed twice. I believe this is because each broker-dealer that is a member of more than one exchange or association is once for each exchange or association of which they are a member.

Yours,

Bonnie

**Sent:** Friday, October 05, 2012 4:00 PM  
**To:** Puskin, Dan - EBSA  
**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337

Forms BD filed in the calendar year ending 12/31/2010 - 285

Forms BD filed in the calendar year ending 12/31/2011 - 216

Forms BDW filed in the calendar year ending 12/31/2009 - 285

Forms BDW filed in the calendar year ending 12/31/2010 - 549

Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

Hi Dan!

Here is the only list we have. We receive this list monthly from FINRA, which maintains the Central Registration Depository system used by broker-dealers to file Forms BD. Forms BD are used to register not only with the SEC, but also with the exchanges and associations (e.g., FINRA or the Chicago Board Options Exchange ("CBOE")), and the states.

The reason there are over 6,000 rows here is because some broker-dealers are listed twice. I believe this is because each broker-dealer that is a member of more than one exchange or association is once for each exchange or association of which they are a member.

Yours,

Bonnie

Hi Dan!

I believe the answer to both of these questions is no. First, what is the definition of "discount broker?" A lot of people use that term, but I don't believe there is one definition. Also, I don't believe it is a question the Commission asks on any of its forms. I also don't believe there is a way to easily isolate those BDs that might be associated with insurance companies. While the SEC probably receives information in this regard, it would not be in a format that would be searchable.

Sorry!

Bonnie

**Sent:** Monday, December 31, 2012 1:53 PM  
**To:** Puskin, Dan - EBSA  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

The study you point to was issued by the Commission on January 22, 2011. On page 8 of this study, the Commission states, "Currently, the Commission oversees approximately 5,100 broker-dealers<sup>11</sup>..."

The corresponding footnote reads, "Unless otherwise specified, the statistics in Section II.A.2 are based on data derived from broker-dealers' responses to questions on the Uniform Application for Broker-Dealer Registration ("Form BD") reported through the Central Registration Depository ("CRD") as of September 30, 2010...."

I would highlight here that the text and footnote indicate that the number of broker-dealers is both "approximate," and based on data collected by the Commission "as of September 30, 2010."

In October, I provided you with data on the number of broker-dealers registered with the Commission as of the calendar years ending December, 2010 and December, 2011.

I hope this addresses your concerns.

**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Dear Dan,

Perhaps I am mistaken, but I didn't read Bonnie's message to mean that the BD number is overstated; I read it to mean that to get the data you were looking for you should reduce the number of Forms BD and Forms BDW filed to account for duplicate filings. I believe you can rely on her 4,813 number as the correct number of total number of BDs.

I'm not sure what the 5,100 number is based on. Would it be OK to wait until Bonnie returns on Monday and she can ask the person who gave her the other statistics? Perhaps that person knows.

Thanks,

Margaret

Dear Ms. Smith,

The only number we need is the total number of broker-dealers. The 5,100 Broker-Dealers estimate in the Dodd-Frank report is based on 2009 numbers. If there was an updated estimate for the total number of broker dealers, that would be very helpful. Here is a link to the version of the report we've been looking at:

[www.sec.gov/news/studies/2011/913studyfinal.pdf](http://www.sec.gov/news/studies/2011/913studyfinal.pdf)

All the best,  
Daniel

**Sent:** Thursday, December 27, 2012 4:58 PM  
**To:** TradingAndMarkets  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Thank you so much for your help in October. The statistics on new broker-dealers have been very useful! I now have a follow up question. In SEC's Dodd-Frank report (*Study on Investment Advisers and Broker-Dealers*), there is a passage that reads as follows:

*"Broker-Dealers: The Commission and FINRA oversee approximately 5,100 broker-dealers. As of the end of 2009, FINRA-registered broker-dealers held over 109 million retail and institutional accounts. Approximately 18% of FINRA-registered broker-dealers also are registered as investment advisers with the Commission or a state. Most broker-dealers receive transaction-based compensation."*

Is it possible to get more updated numbers for the total number of broker-dealers based on 2011 or 2012 submissions?

Happy Holidays,  
Daniel

**Sent:** Friday, October 05, 2012 4:00 PM  
**To:** Puskin, Dan - EBSA  
**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337

Forms BD filed in the calendar year ending 12/31/2010 - 285

Forms BD filed in the calendar year ending 12/31/2011 - 216

Forms BDW filed in the calendar year ending 12/31/2009 - 285

Forms BDW filed in the calendar year ending 12/31/2010 - 549

Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

Dear Ms. Smith,

The only number we need is the total number of broker-dealers. The 5,100 Broker-Dealers estimate in the Dodd-Frank report is based on 2009 numbers. If there was an updated estimate for the total number of broker dealers, that would be very helpful. Here is a link to the version of the report we've been looking at:

[www.sec.gov/news/studies/2011/913studyfinal.pdf](http://www.sec.gov/news/studies/2011/913studyfinal.pdf)

All the best,  
Daniel

**To:** TradingAndMarkets  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Thank you so much for your help in October. The statistics on new broker-dealers have been very useful! I now have a follow up question. In SEC's Dodd-Frank report (*Study on Investment Advisers and Broker-Dealers*), there is a passage that reads as follows:

*"Broker-Dealers: The Commission and FINRA oversee approximately 5,100 broker-dealers. As of the end of 2009, FINRA-registered broker-dealers held over 109 million retail and institutional accounts. Approximately 18% of FINRA-registered broker-dealers also are registered as investment advisers with the Commission or a state. Most broker-dealers receive transaction-based*

compensation.”

Is it possible to get more updated numbers for the total number of broker-dealers based on 2011 or 2012 submissions?

Happy Holidays,  
Daniel

**To:** Puskin, Dan - EBSA  
**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337

Forms BD filed in the calendar year ending 12/31/2010 - 285

Forms BD filed in the calendar year ending 12/31/2011 - 216

Forms BDW filed in the calendar year ending 12/31/2009 - 285

Forms BDW filed in the calendar year ending 12/31/2010 - 549

Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

The study you point to was issued by the Commission on January 22, 2011. On page 8 of this study, the Commission states, "Currently, the Commission oversees approximately 5,100 broker-dealers<sup>11</sup>..."

The corresponding footnote reads, "Unless otherwise specified, the statistics in Section II.A.2 are based on data derived from broker-dealers' responses to questions on the Uniform Application for Broker-Dealer Registration ("Form BD") reported through the Central Registration Depository ("CRD") as of September 30, 2010...."

I would highlight here that the text and footnote indicate that the number of broker-dealers is both "approximate," and based on data collected by the Commission "as of September 30, 2010."

In October, I provided you with data on the number of broker-dealers registered with the Commission as of the calendar years ending December, 2010 and December, 2011.

I hope this addresses your concerns.

**Subject:** RE: Broker-dealer numbers

Dear Dan,

Perhaps I am mistaken, but I didn't read Bonnie's message to mean that the BD number is overstated; I read it to mean that to get the data you were looking for you should reduce the number of Forms BD and Forms BDW filed to account for duplicate filings. I believe you can rely on her 4,813 number as the correct number of total number of BDs.

I'm not sure what the 5,100 number is based on. Would it be OK to wait until Bonnie returns on Monday and she can ask the person who gave her the other statistics? Perhaps that person knows.

Thanks,

Margaret

**Subject:** RE: Broker-dealer numbers

Dear Margaret,

In the statistics sent by Bonnie Gauch, she mentions that the BD number is overstated (see her message below). Is the 5,100 used in the Dodd-Frank report based on the 5,061 filers from 2010 or is it based on an adjustment to the 5,257 number in 2009.

Thanks for all your help!  
Dan

**To:** TradingAndMarkets

**Cc:** Beckmann, Allan - EBSA

**Subject:** RE: Broker-dealer numbers

Thank you so much for your help in October. The statistics on new broker-dealers have been very useful! I now have a follow up question. In SEC's Dodd-Frank report (*Study on Investment Advisers and Broker-Dealers*), there is a passage that reads as follows:

*“Broker-Dealers: The Commission and FINRA oversee approximately 5,100 broker-dealers. As of the end of 2009, FINRA-registered broker-dealers held over 109 million retail and institutional accounts. Approximately 18% of FINRA-registered broker-dealers also are registered as investment advisers with the Commission or a state. Most broker-dealers receive transaction-based compensation.”*

Is it possible to get more updated numbers for the total number of broker-dealers based on 2011 or 2012 submissions?

Happy Holidays,

Daniel

**To:** Puskin, Dan - EBSA

**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337

Forms BD filed in the calendar year ending 12/31/2010 - 285

Forms BD filed in the calendar year ending 12/31/2011 - 216

Forms BDW filed in the calendar year ending 12/31/2009 - 285

Forms BDW filed in the calendar year ending 12/31/2010 - 549

Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

**Subject:** RE: Broker-dealer numbers

Hi Dan!

I believe the answer to both of these questions is no. First, what is the definition of "discount broker?" A lot of people use that term, but I don't believe there is one definition. Also, I don't believe it is a question the Commission asks on any of its forms. I also don't believe there is a way to easily isolate those BDs that might be associated with insurance companies. While the SEC probably receives information in this regard, it would not be in a format that would be searchable.

Sorry!

Bonnie

**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

The study you point to was issued by the Commission on January 22, 2011. On page 8 of this study, the Commission states, "Currently, the Commission oversees approximately 5,100 broker-dealers<sup>11</sup>..."

The corresponding footnote reads, "Unless otherwise specified, the statistics in Section II.A.2 are based on data derived from broker-dealers' responses to questions on the Uniform Application for Broker-Dealer Registration ("Form BD") reported through the Central Registration Depository ("CRD") as of September 30, 2010...."

I would highlight here that the text and footnote indicate that the number of broker-dealers is both "approximate," and based on data collected by the Commission "as of September 30, 2010."

In October, I provided you with data on the number of broker-dealers registered with the Commission as of the calendar years ending December, 2010 and December, 2011.

I hope this addresses your concerns.

Dear Daniel,

Thank you for the clarification. There were 4,813 broker-dealers registered with the Commission as of 12/31/2011. I don't know when the 2012 number will be available; I believe the number is reported annually, but I don't know when.

Please let us know if we can help with anything else!

Margaret

**To:** TradingAndMarkets  
**Subject:** RE: Broker-dealer numbers

Dear Ms. Smith,

The only number we need is the total number of broker-dealers. The 5,100 Broker-Dealers estimate in the Dodd-Frank report is based on 2009 numbers. If there was an updated estimate for the total number of broker dealers, that would be very helpful. Here is a link to the version of the report we've been looking at:

[www.sec.gov/news/studies/2011/913studyfinal.pdf](http://www.sec.gov/news/studies/2011/913studyfinal.pdf)

All the best,  
Daniel

**Sent:** Thursday, December 27, 2012 4:58 PM  
**To:** TradingAndMarkets  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Thank you so much for your help in October. The statistics on new broker-dealers have been very useful! I now have a follow up question. In SEC's Dodd-Frank report (*Study on Investment Advisers and Broker-Dealers*), there is a passage that reads as follows:

*"Broker-Dealers: The Commission and FINRA oversee approximately 5,100 broker-dealers. As of*

the end of 2009, FINRA-registered broker-dealers held over 109 million retail and institutional accounts. Approximately 18% of FINRA-registered broker-dealers also are registered as investment advisers with the Commission or a state. Most broker-dealers receive transaction-based compensation.”

Is it possible to get more updated numbers for the total number of broker-dealers based on 2011 or 2012 submissions?

Happy Holidays,  
Daniel

**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337

Forms BD filed in the calendar year ending 12/31/2010 - 285

Forms BD filed in the calendar year ending 12/31/2011 - 216

Forms BDW filed in the calendar year ending 12/31/2009 - 285

Forms BDW filed in the calendar year ending 12/31/2010 - 549

Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered

with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

Hi Dan!

I believe the answer to both of these questions is no. First, what is the definition of "discount broker?" A lot of people use that term, but I don't believe there is one definition. Also, I don't believe it is a question the Commission asks on any of its forms. I also don't believe there is a way to easily isolate those BDs that might be associated with insurance companies. While the SEC probably receives information in this regard, it would not be in a format that would be searchable.

Sorry!

Bonnie

**To:** Puskin, Dan - EBSA  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

The study you point to was issued by the Commission on January 22, 2011. On page 8 of this study, the Commission states, "Currently, the Commission oversees approximately 5,100 broker-dealers<sup>11</sup>..."

The corresponding footnote reads, "Unless otherwise specified, the statistics in Section II.A.2 are based on data derived from broker-dealers' responses to questions on the Uniform Application for Broker-Dealer Registration ("Form BD") reported through the Central Registration Depository ("CRD") as of September 30, 2010...."

I would highlight here that the text and footnote indicate that the number of broker-dealers is both "approximate," and based on data collected by the Commission "as of September 30, 2010."

In October, I provided you with data on the number of broker-dealers registered with the Commission as of the calendar years ending December, 2010 and December, 2011.

I hope this addresses your concerns.

**Subject:** RE: Broker-dealer numbers

Dear Ms. Smith,

The only number we need is the total number of broker-dealers. The 5,100 Broker-Dealers estimate in the Dodd-Frank report is based on 2009 numbers. If there was an updated estimate for the total

number of broker dealers, that would be very helpful. Here is a link to the version of the report we've been looking at:

[www.sec.gov/news/studies/2011/913studyfinal.pdf](http://www.sec.gov/news/studies/2011/913studyfinal.pdf)

All the best,  
Daniel

**To:** TradingAndMarkets  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Thank you so much for your help in October. The statistics on new broker-dealers have been very useful! I now have a follow up question. In SEC's Dodd-Frank report (*Study on Investment Advisers and Broker-Dealers*), there is a passage that reads as follows:

*"Broker-Dealers: The Commission and FINRA oversee approximately 5,100 broker-dealers. As of the end of 2009, FINRA-registered broker-dealers held over 109 million retail and institutional accounts. Approximately 18% of FINRA-registered broker-dealers also are registered as investment advisers with the Commission or a state. Most broker-dealers receive transaction-based compensation."*

Is it possible to get more updated numbers for the total number of broker-dealers based on 2011 or 2012 submissions?

Happy Holidays,  
Daniel

**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337

Forms BD filed in the calendar year ending 12/31/2010 - 285

Forms BD filed in the calendar year ending 12/31/2011 - 216

Forms BDW filed in the calendar year ending 12/31/2009 - 285

Forms BDW filed in the calendar year ending 12/31/2010 - 549

Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

Hi Dan!

I believe the answer to both of these questions is no.

First, what is the definition of “discount broker?” A lot of people use that term, but I don’t believe there is one definition. Also, I don’t believe it is a question the Commission asks on any of its forms. I also don’t believe there is a way to easily isolate those BDs that might be associated with insurance companies. While the SEC probably receives information in this regard, it would not be in a format that would be searchable.

Sorry!

**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

The study you point to was issued by the Commission on January 22, 2011. On page 8 of this study, the Commission states, "Currently, the Commission oversees approximately 5,100 broker-dealers<sup>11</sup>..."

The corresponding footnote reads, "Unless otherwise specified, the statistics in Section II.A.2 are based on data derived from broker-dealers' responses to questions on the Uniform Application for Broker-Dealer Registration ("Form BD") reported through the Central Registration Depository ("CRD") as of September 30, 2010...."

I would highlight here that the text and footnote indicate that the number of broker-dealers is both "approximate," and based on data collected by the Commission "as of September 30, 2010."

In October, I provided you with data on the number of broker-dealers registered with the Commission as of the calendar years ending December, 2010 and December, 2011.

I hope this addresses your concerns.

Hi Dan!

Here is a rule release with a good discussion of the small business issue:

<http://www.sec.gov/rules/proposed/2007/34-55431fr.pdf>.

I had to go back a couple of years because since Dodd-Frank the rulemakings seem to be more about security-based swap dealers rather than broker-dealers.

Attached also is a release regarding our rule wherein we define the term "small entity" with respect to broker-dealers (at bottom of third column).

I hope these are helpful.

Bonnie,

Sorry to bother you again. I have a follow up question concerning the fraction of broker dealers providing advice. Does it seem right to you that only 20 (927/4612) of the Broker-Dealers provide investment advice? Does that mean that the other 80 percent provide no retirement planning services, asset allocation assistance, etc.? Or, are the BDs interpreting Question 12 Item "S" differently than I would, or just not filling out that part of the questionnaire? Thanks again for all your help.

Best,  
Dan

Dear Dr. Puskin,

Bonnie is out this week, and I'm filling in for her.

Would you mind clarifying which number(s) you would like updated?

Thanks,

Margaret Smith

**Sent:** Thursday, December 27, 2012 4:58 PM  
**To:** TradingAndMarkets  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Thank you so much for your help in October. The statistics on new broker-dealers have been very useful! I now have a follow up question. In SEC's Dodd-Frank report (*Study on Investment Advisers and Broker-Dealers*), there is a passage that reads as follows:

*“Broker-Dealers: The Commission and FINRA oversee approximately 5,100 broker-dealers. As of the end of 2009, FINRA-registered broker-dealers held over 109 million retail and institutional accounts. Approximately 18% of FINRA-registered broker-dealers also are registered as investment advisers with the Commission or a state. Most broker-dealers receive transaction-based compensation.”*

Is it possible to get more updated numbers for the total number of broker-dealers based on 2011 or 2012 submissions?

Happy Holidays,  
Daniel

**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337

Forms BD filed in the calendar year ending 12/31/2010 - 285

Forms BD filed in the calendar year ending 12/31/2011 - 216

Forms BDW filed in the calendar year ending 12/31/2009 - 285

Forms BDW filed in the calendar year ending 12/31/2010 - 549

Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

Hi Bonnie,

Is there any designation on whether the BD provides investment advice? On the Form BD, Question 12 looks particularly useful. For example, is there a distribution of how respondents answered question 12 part S (relating to investment advisory services) on the Form BD?

Thanks,  
Dan

Hi Dan!

I believe the answer to both of these questions is no.

First, what is the definition of “discount broker?” A lot of people use that term, but I don’t believe there is one definition. Also, I don’t believe it is a question the Commission asks on any of its forms. I also don’t believe there is a way to easily isolate those BDs that might be associated with insurance companies. While the SEC probably receives information in this regard, it would not be in a format that would be searchable.

Sorry!

Bonnie

Hi Bonnie,

We have a couple more questions concerning the broker-dealer counts. Is there any way to break down whether the broker-dealers are discount brokers versus full service brokers? Also, can we separate out counts for whether the broker-dealer is affiliated with an insurance company or not?

Thank you for all your help in this process!

**To:** Puskin, Dan - EBSA  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

The study you point to was issued by the Commission on January 22, 2011. On page 8 of this study, the Commission states, "Currently, the Commission oversees approximately 5,100 broker-dealers<sup>11</sup>..."

The corresponding footnote reads, "Unless otherwise specified, the statistics in Section II.A.2 are based on data derived from broker-dealers' responses to questions on the Uniform Application for Broker-Dealer Registration ("Form BD") reported through the Central Registration Depository ("CRD") as of September 30, 2010...."

I would highlight here that the text and footnote indicate that the number of broker-dealers is both "approximate," and based on data collected by the Commission "as of September 30, 2010."

In October, I provided you with data on the number of broker-dealers registered with the Commission as of the calendar years ending December, 2010 and December, 2011.

I hope this addresses your concerns.

**Subject:** RE: Broker-dealer numbers

Dear Dan,

Perhaps I am mistaken, but I didn't read Bonnie's message to mean that the BD number is overstated; I read it to mean that to get the data you were looking for you should reduce the number of Forms BD and Forms BDW filed to account for duplicate filings. I believe you can rely on her 4,813 number as the correct number of total number of BDs.

I'm not sure what the 5,100 number is based on. Would it be OK to wait until Bonnie returns on Monday and she can ask the person who gave her the other statistics? Perhaps that person knows.

Thanks,

Margaret

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337  
Forms BD filed in the calendar year ending 12/31/2010 - 285  
Forms BD filed in the calendar year ending 12/31/2011 - 216  
Forms BDW filed in the calendar year ending 12/31/2009 - 285

Forms BDW filed in the calendar year ending 12/31/2010 - 549

Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

Bonnie Gauch

**Subject:** RE: Broker-dealer numbers

Hi Dan!

I believe the answer to both of these questions is no. First, what is the definition of "discount broker?" A lot of people use that term, but I don't believe there is one definition. Also, I don't believe it is a question the Commission asks on any of its forms. I also don't believe there is a way to easily isolate those BDs that might be associated with insurance companies. While the SEC probably receives information in this regard, it would not be in a format that would be searchable.

Sorry!

Bonnie

**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

The study you point to was issued by the Commission on January 22, 2011. On page 8 of this study, the Commission states, "Currently, the Commission oversees approximately 5,100 broker-dealers<sup>11</sup>..."

The corresponding footnote reads, "Unless otherwise specified, the statistics in Section II.A.2 are based on data derived from broker-dealers' responses to questions on the Uniform Application for Broker-Dealer Registration ("Form BD") reported through the Central Registration Depository ("CRD") as of September 30, 2010...."

I would highlight here that the text and footnote indicate that the number of broker-dealers is both "approximate," and based on data collected by the Commission "as of September 30, 2010."

In October, I provided you with data on the number of broker-dealers registered with the Commission as of the calendar years ending December, 2010 and December, 2011.

I hope this addresses your concerns.

**To:** TradingAndMarkets  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Thank you so much for your help in October. The statistics on new broker-dealers have been very useful! I now have a follow up question. In SEC's Dodd-Frank report (*Study on Investment Advisers and Broker-Dealers*), there is a passage that reads as follows:

*“Broker-Dealers: The Commission and FINRA oversee approximately 5,100 broker-dealers. As of the end of 2009, FINRA-registered broker-dealers held over 109 million retail and institutional accounts. Approximately 18% of FINRA-registered broker-dealers also are registered as investment advisers with the Commission or a state. Most broker-dealers receive transaction-based compensation.”*

Is it possible to get more updated numbers for the total number of broker-dealers based on 2011 or 2012 submissions?

Happy Holidays,  
Daniel

**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337

Forms BD filed in the calendar year ending 12/31/2010 - 285

Forms BD filed in the calendar year ending 12/31/2011 - 216

Forms BDW filed in the calendar year ending 12/31/2009 - 285

Forms BDW filed in the calendar year ending 12/31/2010 - 549

Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

Hi Bonnie,

Thank you so much for all your help! If we wanted to state the total number of broker-dealers in the United States that have commission based arrangements, would 5,100 be a good estimate, or are we missing some set of BDs that is not included in that statistic?

Best,  
Dan

**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

The study you point to was issued by the Commission on January 22, 2011. On page 8 of this study, the Commission states, "Currently, the Commission oversees approximately 5,100 broker-dealers<sup>11</sup>..."

The corresponding footnote reads, "Unless otherwise specified, the statistics in Section II.A.2 are based on data derived from broker-dealers' responses to questions on the Uniform Application for Broker-Dealer Registration ("Form BD") reported through the Central Registration Depository ("CRD") as of September 30, 2010..."

I would highlight here that the text and footnote indicate that the number of broker-dealers is both "approximate," and based on data collected by the Commission "as of September 30, 2010."

In October, I provided you with data on the number of broker-dealers registered with the Commission as of the calendar years ending December, 2010 and December, 2011.

I hope this addresses your concerns.

**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Dear Dan,

Perhaps I am mistaken, but I didn't read Bonnie's message to mean that the BD number is overstated; I read it to mean that to get the data you were looking for you should reduce the number of Forms BD and Forms BDW filed to account for duplicate filings. I believe you can rely on her 4,813 number as the correct number of total number of BDs.

I'm not sure what the 5,100 number is based on. Would it be OK to wait until Bonnie returns on Monday and she can ask the person who gave her the other statistics? Perhaps that person knows.

Thanks,

Margaret

Dear Margaret,

In the statistics sent by Bonnie Gauch, she mentions that the BD number is overstated (see her message below). Is the 5,100 used in the Dodd-Frank report based on the 5,061 filers from 2010 or is it based on an adjustment to the 5,257 number in 2009.

Thanks for all your help!  
Dan

Dear Ms. Smith,

The only number we need is the total number of broker-dealers. The 5,100 Broker-Dealers estimate in the Dodd-Frank report is based on 2009 numbers. If there was an updated estimate for the total number of broker dealers, that would be very helpful. Here is a link to the version of the report we've been looking at:

[www.sec.gov/news/studies/2011/913studyfinal.pdf](http://www.sec.gov/news/studies/2011/913studyfinal.pdf)

All the best,  
Daniel

**Sent:** Thursday, December 27, 2012 4:58 PM  
**To:** TradingAndMarkets  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Thank you so much for your help in October. The statistics on new broker-dealers have been very useful! I now have a follow up question. In SEC's Dodd-Frank report (*Study on Investment Advisers and Broker-Dealers*), there is a passage that reads as follows:

*"Broker-Dealers: The Commission and FINRA oversee approximately 5,100 broker-dealers. As of the end of 2009, FINRA-registered broker-dealers held over 109 million retail and institutional accounts. Approximately 18% of FINRA-registered broker-dealers also are registered as investment advisers with the Commission or a state. Most broker-dealers receive transaction-based compensation."*

Is it possible to get more updated numbers for the total number of broker-dealers based on 2011 or

2012 submissions?

Happy Holidays,  
Daniel

**Sent:** Friday, October 05, 2012 4:00 PM  
**To:** Puskin, Dan - EBSA  
**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337  
Forms BD filed in the calendar year ending 12/31/2010 - 285  
Forms BD filed in the calendar year ending 12/31/2011 - 216  
Forms BDW filed in the calendar year ending 12/31/2009 - 285  
Forms BDW filed in the calendar year ending 12/31/2010 - 549  
Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

Hi Dan!

I believe the answer to both of these questions is no.

First, what is the definition of "discount broker?" A lot of people use that term, but I don't believe there is one definition. Also, I don't believe it is a question the Commission asks on any of its forms. I also don't believe there is a way to easily isolate those BDs that might be associated with insurance companies. While the SEC probably receives information in this regard, it would not be in a format that would be searchable.

Sorry!

Bonnie

Hi Bonnie,

We have a couple more questions concerning the broker-dealer counts. Is there any way to break down whether the broker-dealers are discount brokers versus full service brokers? Also, can we separate out counts for whether the broker-dealer is affiliated with an insurance company or not?

Thank you for all your help in this process!

**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337  
Forms BD filed in the calendar year ending 12/31/2010 - 285  
Forms BD filed in the calendar year ending 12/31/2011 - 216  
Forms BDW filed in the calendar year ending 12/31/2009 - 285  
Forms BDW filed in the calendar year ending 12/31/2010 - 549  
Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

Hi Bonnie,

Thank you so much for all your help! If we wanted to state the total number of broker-dealers in the United States that have commission based arrangements, would 5,100 be a good estimate, or are we missing some set of BDs that is not included in that statistic?

Best,  
Dan

**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

The study you point to was issued by the Commission on January 22, 2011. On page 8 of this study, the Commission states, "Currently, the Commission oversees approximately 5,100 broker-dealers<sup>11</sup>..."

The corresponding footnote reads, "Unless otherwise specified, the statistics in Section II.A.2 are based on data derived from broker-dealers' responses to questions on the Uniform Application for Broker-Dealer Registration ("Form BD") reported through the Central Registration Depository ("CRD") as of September 30, 2010..."

I would highlight here that the text and footnote indicate that the number of broker-dealers is both "approximate," and based on data collected by the Commission "as of September 30, 2010."

In October, I provided you with data on the number of broker-dealers registered with the Commission as of the calendar years ending December, 2010 and December, 2011.

I hope this addresses your concerns.

**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Dear Dan,

Perhaps I am mistaken, but I didn't read Bonnie's message to mean that the BD number is overstated; I read it to mean that to get the data you were looking for you should reduce the number of Forms BD and Forms BDW filed to account for duplicate filings. I believe you can rely on her 4,813 number as the correct number of total number of BDs.

I'm not sure what the 5,100 number is based on. Would it be OK to wait until Bonnie returns on Monday and she can ask the person who gave her the other statistics? Perhaps that person knows.

Thanks,

Margaret

Dear Margaret,

In the statistics sent by Bonnie Gauch, she mentions that the BD number is overstated (see her message below). Is the 5,100 used in the Dodd-Frank report based on the 5,061 filers from 2010 or is it based on an adjustment to the 5,257 number in 2009.

Thanks for all your help!

Dan

Dear Ms. Smith,

The only number we need is the total number of broker-dealers. The 5,100 Broker-Dealers estimate in the Dodd-Frank report is based on 2009 numbers. If there was an updated estimate for the total number of broker dealers, that would be very helpful. Here is a link to the version of the report we've been looking at:

[www.sec.gov/news/studies/2011/913studyfinal.pdf](http://www.sec.gov/news/studies/2011/913studyfinal.pdf)

All the best,  
Daniel

**To:** TradingAndMarkets  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Thank you so much for your help in October. The statistics on new broker-dealers have been very useful! I now have a follow up question. In SEC's Dodd-Frank report (*Study on Investment Advisers and Broker-Dealers*), there is a passage that reads as follows:

*"Broker-Dealers: The Commission and FINRA oversee approximately 5,100 broker-dealers. As of the end of 2009, FINRA-registered broker-dealers held over 109 million retail and institutional accounts. Approximately 18% of FINRA-registered broker-dealers also are registered as investment advisers with the Commission or a state. Most broker-dealers receive transaction-based compensation."*

Is it possible to get more updated numbers for the total number of broker-dealers based on 2011 or

2012 submissions?

**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw

from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337

Forms BD filed in the calendar year ending 12/31/2010 - 285

Forms BD filed in the calendar year ending 12/31/2011 - 216

Forms BDW filed in the calendar year ending 12/31/2009 - 285

Forms BDW filed in the calendar year ending 12/31/2010 - 549

Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

Bonnie Gauch  
Attorney

**To:** Puskin, Dan - EBSA; TradingAndMarkets  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Dear Dan,

Perhaps I am mistaken, but I didn't read Bonnie's message to mean that the BD number is overstated; I read it to mean that to get the data you were looking for you should reduce the number of Forms BD and Forms BDW filed to account for duplicate filings. I believe you can rely on her 4,813 number as the correct number of total number of BDs.

I'm not sure what the 5,100 number is based on. Would it be OK to wait until Bonnie returns on Monday and she can ask the person who gave her the other statistics? Perhaps that person knows.

Thanks,

Margaret

Dear Margaret,

In the statistics sent by Bonnie Gauch, she mentions that the BD number is overstated (see her message below). Is the 5,100 used in the Dodd-Frank report based on the 5,061 filers from 2010 or is it based on an adjustment to the 5,257 number in 2009.

Thanks for all your help!

Dan

Dear Daniel,

Thank you for the clarification. There were 4,813 broker-dealers registered with the Commission as of 12/31/2011. I don't know when the 2012 number will be available; I believe the number is reported annually, but I don't know when.

Please let us know if we can help with anything else!

Margaret

Dear Ms. Smith,

The only number we need is the total number of broker-dealers. The 5,100 Broker-Dealers estimate in the Dodd-Frank report is based on 2009 numbers. If there was an updated estimate for the total number of broker dealers, that would be very helpful. Here is a link to the version of the report

we've been looking at:

**To:** TradingAndMarkets  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Thank you so much for your help in October. The statistics on new broker-dealers have been very useful! I now have a follow up question. In SEC's Dodd-Frank report (*Study on Investment Advisers and Broker-Dealers*), there is a passage that reads as follows:

*"Broker-Dealers: The Commission and FINRA oversee approximately 5,100 broker-dealers. As of the end of 2009, FINRA-registered broker-dealers held over 109 million retail and institutional accounts. Approximately 18% of FINRA-registered broker-dealers also are registered as investment advisers with the Commission or a state. Most broker-dealers receive transaction-based compensation."*

Is it possible to get more updated numbers for the total number of broker-dealers based on 2011 or 2012 submissions?

Happy Holidays,  
Daniel

*“Broker-Dealers: The Commission and FINRA oversee approximately 5,100 broker-dealers. As of the end of 2009, FINRA-registered broker-dealers held over 109 million retail and institutional accounts. Approximately 18% of FINRA-registered broker-dealers also are registered as investment advisers with the Commission or a state. Most broker-dealers receive transaction-based compensation.”*

Is it possible to get more updated numbers for the total number of broker-dealers based on 2011 or 2012 submissions?

Happy Holidays,  
Daniel

**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337

Forms BD filed in the calendar year ending 12/31/2010 - 285

Forms BD filed in the calendar year ending 12/31/2011 - 216

Forms BDW filed in the calendar year ending 12/31/2009 - 285

Forms BDW filed in the calendar year ending 12/31/2010 - 549

Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you

the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

Dear Margaret,

In the statistics sent by Bonnie Gauch, she mentions that the BD number is overstated (see her message below). Is the 5,100 used in the Dodd-Frank report based on the 5,061 filers from 2010 or is it based on an adjustment to the 5,257 number in 2009.

Thanks for all your help!

Dan

Dear Daniel,

Thank you for the clarification. There were 4,813 broker-dealers registered with the Commission as of 12/31/2011. I don't know when the 2012 number will be available; I believe the number is reported annually, but I don't know when.

Please let us know if we can help with anything else!

Dear Ms. Smith,

The only number we need is the total number of broker-dealers. The 5,100 Broker-Dealers estimate in the Dodd-Frank report is based on 2009 numbers. If there was an updated estimate for the total number of broker dealers, that would be very helpful. Here is a link to the version of the report we've been looking at:

Hi Dan!

My IM colleague confirms that in a typical year about 1,000 to 1,100 investment adviser registrations are approved.  
He says that the percentage of new registered advisers in a typical year is generally about 9-10% of the adviser population annually.

Bonnie

This is excellent! So, if I have it right, pre-Dodd-Frank, approximately 10 percent of registrants with the SEC were new each year (1,100 approved registrations of approximately 10,754). Does that sound right?

Best,  
Dan

**Sent:** Friday, July 19, 2013 8:13 AM  
**To:** Puskin, Dan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

Apparently, we can only get approved registrations where the adviser remained registered at the end of the year.

This will cause the data will be a little bit off (very minor) for a few advisers that withdrew their registrations, reapplied for registration, and were approved in the same calendar year.

The withdrawals include advisers that switched to state registration.

Initial registrations include advisers that applied for registration but were never approved because they did not provide a complete application (or for other reasons).

Exempt Reporting Advisers or "ERAs" did not exist before 2012.

The data for calendar year 2012 is unusual because certain regulatory changes (i.e., the Dodd Frank Act) required that certain advisers switch to state registration, and also required unregistered advisers to private funds to register with the SEC.

The staff believes that the Commission historically has about 1,100 new registrations each year and about 700-800 withdrawals, and that the absolute growth of advisers is about 300 per year in a normal year (300 more registrations approved than withdrawals).

|      | ADV-W withdrawals | Initial Registration Requests | Registration Approved | ERAs  |
|------|-------------------|-------------------------------|-----------------------|-------|
| 2012 | 3,048             | 2,121                         | 2,000                 | 2,330 |
| 2011 | 832               | 903                           | 806                   | N/A   |
| 2010 | 801               | 1,133                         | 1,036                 | N/A   |

Hi Bonnie,

Calendar year is good. Separate info on the exempt reporting advisers would be interesting to have. Number of new distinct registered investment advisers would be most useful. Not having the state info is okay-- just need some sense of what fraction of RIAs are new each year. Thanks again for all your help!

All the best,  
Dan

**To:** Puskin, Dan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

Is calendar year basis OK or do you need fiscal year?

Are you looking for the number of registration requests (which may not all have been approved), the number of approved registrations, or the actual increase in the number of registered investment advisers?

Do you also want numbers on the exempt reporting advisers (which just file info but are not approved or rejected)

Finally, my colleague wants to note that we don't have state data (smaller investment advisers do not need to register with the Commission, but may need to register with the various states).

**To:** Puskin, Dan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

When I asked my colleague in Investment Management, he indicated that there were 2,331 SEC exempt reporting advisers filing reports with the SEC as of January 1, 2013, and there were 17,259 state-registered investment advisers (699 state ERAs) as of January 1, 2013. There is some double counting of advisers as about 124 SEC-registered investment advisers are also state-registered investment advisers and 540 SEC exempt reporting advisers are also state exempt reporting advisers as of January 1, 2013.

**Subject:** RE: Broker-dealer numbers

Hi Dan!

Here is the only list we have. We receive this list monthly from FINRA, which maintains the Central Registration Depository system used by broker-dealers to file Forms BD. Forms BD are used to register not only with the SEC, but also with the exchanges and associations (e.g., FINRA or the Chicago Board Options Exchange ("CBOE")), and the states.

The reason there are over 6,000 rows here is because some broker-dealers are listed twice. I believe this is because each broker-dealer that is a member of more than one exchange or association is once for each exchange or association of which they are a member.

Yours,

Bonnie

**Subject:** RE: Broker-dealer numbers

Hi Dan!

I believe the answer to both of these questions is no. First, what is the definition of "discount broker?" A lot of people use that term, but I don't believe there is one definition. Also, I don't believe it is a question the Commission asks on any of its forms. I also don't believe there is a way to easily isolate those BDs that might be associated with insurance companies. While the SEC probably receives information in this regard, it would not be in a format that would be searchable.

Sorry!

**To:** Puskin, Dan - EBSA  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Hi Dan!

The study you point to was issued by the Commission on January 22, 2011. On page 8 of this study, the Commission states, "Currently, the Commission oversees approximately 5,100 broker-dealers<sup>11</sup>..."

The corresponding footnote reads, "Unless otherwise specified, the statistics in Section II.A.2 are based on data derived from broker-dealers' responses to questions on the Uniform Application for Broker-Dealer Registration ("Form BD") reported through the Central Registration Depository ("CRD") as of September 30, 2010...."

I would highlight here that the text and footnote indicate that the number of broker-dealers is both "approximate," and based on data collected by the Commission "as of September 30, 2010."

In October, I provided you with data on the number of broker-dealers registered with the Commission as of the calendar years ending December, 2010 and December, 2011.

I hope this addresses your concerns.

**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Dear Dan,

Perhaps I am mistaken, but I didn't read Bonnie's message to mean that the BD number is overstated; I read it to mean that to get the data you were looking for you should reduce the

number of Forms BD and Forms BDW filed to account for duplicate filings. I believe you can rely on her 4,813 number as the correct number of total number of BDs.

I'm not sure what the 5,100 number is based on. Would it be OK to wait until Bonnie returns on Monday and she can ask the person who gave her the other statistics? Perhaps that person knows.

Thanks,

Margaret

Dear Margaret,

In the statistics sent by Bonnie Gauch, she mentions that the BD number is overstated (see her message below). Is the 5,100 used in the Dodd-Frank report based on the 5,061 filers from 2010 or is it based on an adjustment to the 5,257 number in 2009.

Thanks for all your help!

Dear Ms. Smith,

The only number we need is the total number of broker-dealers. The 5,100 Broker-Dealers estimate in the Dodd-Frank report is based on 2009 numbers. If there was an updated estimate for the total number of broker dealers, that would be very helpful. Here is a link to the version of the report we've been looking at:

[www.sec.gov/news/studies/2011/913studyfinal.pdf](http://www.sec.gov/news/studies/2011/913studyfinal.pdf)

**To:** TradingAndMarkets  
**Cc:** Beckmann, Allan - EBSA  
**Subject:** RE: Broker-dealer numbers

Thank you so much for your help in October. The statistics on new broker-dealers have been very useful! I now have a follow up question. In SEC's Dodd-Frank report (*Study on Investment Advisers and Broker-Dealers*), there is a passage that reads as follows:

**“Broker-Dealers:** The Commission and FINRA oversee approximately 5,100 broker-dealers. As of the end of 2009, FINRA-registered broker-dealers held over 109 million retail and institutional accounts. Approximately 18% of FINRA-registered broker-dealers also are registered as investment advisers with the Commission or a state. Most broker-dealers receive transaction-based compensation.”

Is it possible to get more updated numbers for the total number of broker-dealers based on 2011 or 2012 submissions?

Happy Holidays,  
Daniel

Daniel Puskin, PhD

**From:** TradingAndMarkets [REDACTED]@SEC.GOV]  
**Sent:** Friday, October 05, 2012 4:00 PM  
**To:** Puskin, Dan - EBSA  
**Subject:** Broker-dealer numbers

Hi Daniel!

I guess we don't keep track of the number of new BDs registered and the number of BDs that exited – instead we keep track of the number of Forms BD (to initiate registration) and BDW (to withdraw from registration) filed.

These numbers are as follows:

Forms BD filed in the calendar year ending 12/31/2009 - 337  
Forms BD filed in the calendar year ending 12/31/2010 - 285  
Forms BD filed in the calendar year ending 12/31/2011 - 216  
Forms BDW filed in the calendar year ending 12/31/2009 - 285  
Forms BDW filed in the calendar year ending 12/31/2010 - 549  
Forms BDW filed in the calendar year ending 12/31/2011 – 378

These would include possible duplicate filings (deficient Forms BDW where the firm was required to re-file the Form, and BD apps that were never accepted or were withdrawn before they started business). The expert here who deals with these filings suggests reducing the number of Forms BD by 5% and the number of Forms BDW by 10% to account for these duplicates.

As you are an economist, I am providing the raw numbers and the suggested reductions to allow you the ability to either retain the raw number or reduce the raw numbers, as suggested.

In addition, the total number of broker-dealers and the number of small broker-dealers registered with the Commission as of 12/31/2009, 12/31/2010, and 12/31/2011 were 5,257 and 927, 5,061 and 841, and 4,813 and 808, respectively.

I hope this is helpful to you.

Have a terrific weekend!

**Subject:** DOL call

Sorry for the multiple e-mails!

The DOL's Chief Economist phoned me yesterday when he saw that many people from our working group had accepted the call for today. He is happy we are all participating but wanted to let me know that he really hopes the hour will be filled with insights from the academics. I think he is worried we might take over the call, but I told him that we viewed this as the DOL's call, and that we wouldn't hijack the meeting.

Thanks,

J.

**Subject:** RE: Estimate of Affected Broker-Dealer Reps  
**Date:** Thursday, June 27, 2013 1:25:00 PM

---

The Cerulli source is the Advisor Metrics 2011 report-- Exhibit 1.04 "Historical Change in Total Advisors by Channel 2004-2010" Also, you'll notice that in Exhibit 1.10 "Top -25 Broker/Dealers by Advisor Headcount 2004-2010" that certain companies like Charles Schwab, Fidelity and Vanguard are omitted. We asked Cerulli about it. Below is our e-mail exchange with them. After reading their responses, I am still unsure whether their counts include all the advice delivering reps we need for our estimate.

Thanks,  
Dan

---

Keith and Dan,

I can answer both questions.

1) When we are sizing advisors, we are scrubbing out RIAs and Series 7 licensed reps that are not providing wealth management services. RIAs have to have at least 25% in Retail Assets and are offering wealth management services to end investor. For example, BlackRock is an RIA but not a Retail RIA.

2) Fidelity and Vanguard are part of our Direct Channel as they are offering centralized advice and therefore not part of our Retail Advisor Sizing.

Let me know if you want to chat this afternoon or anytime this week and will be happy to discuss further.

Best,  
Austin

**Subject:** questions for analyst

---

Hi Austin,

Here are a couple questions we have for an analyst. These questions are on the 2011 Advisor Metrics report

- 1) Exhibit 1.04 – Where do the advisor numbers come from? According to the SEC, there are over 600,000 broker-dealers, but the chart lists much fewer of them as advisors. How do you define/determine which of them are advisors? Similarly for RIAs, according to the SEC Dodd-Frank report, there are about 275,000 state registered RIAs, but the number of RIA advisors in the chart is much lower.
- 2) Exhibit 1.10 – Why don't Fidelity and Vanguard appear on the list? Are their representatives not registered as broker-dealers, or are they broker-dealers, but not considered to be advisors?

We are available tomorrow, Friday, or next Monday or Tuesday to discuss these questions

Thanks,  
Keith

**Cc:** Bergstresser, Keith - EBSA  
**Subject:** Estimate of Affected Broker-Dealer Reps

Hi Matt,

I have a question that relates to our cost benefit analysis and was hoping you could help. We anticipate that by changing the definition of fiduciary under ERISA, certain service providers and their reps will incur higher liability costs (in the form of higher errors and omissions insurance). Thus, we need an estimate of the number of broker dealer reps who might be facing higher liability insurance as a consequence of performing functions that will newly be held to a fiduciary standard.

To get this estimate, we need a count of the number of BD reps who deliver advice in the retail market. The SEC's Dodd Frank Report ([www.sec.gov/news/studies/2011/913studyfinal.pdf](http://www.sec.gov/news/studies/2011/913studyfinal.pdf)) estimated that there were 600,000 BD reps. However, it is my understanding that many of these reps do not provide advice to retail investors in DC plans or IRAs (or provide advice at all). Cerulli Associates' *Advisor Metrics 2011* estimates that there are approximately 300,000 BD reps who qualify as "advisors". Do you think this number is more appropriate, or would some other source be better? Any assistance you could provide would be very useful.

Best,  
Dan

Dear Dan,

It does not seem like there is an easy solution to your problem, especially in relation to the number of reps that provide advice in DC plans or IRAs, or as you say, provide advice at all. The difficulty to even distinguish between discount BDs and full-service BDs that provide advice is also difficult considering some discount BDs provide advice.

Our best source for these market sizing issues would be the Cerulli reports or anything that we can find online.

<<FY 2014 Appropriations Hearing (Record Insert Fiduciary Standards).docx>> Mark,

Per our conversation, attached is our draft insert. As I mentioned, our Acting Secretary was testifying before the Congress last week and, as follow up to that testimony, DOL has been asked to provide an explanation of the differences in the fiduciary standard under ERISA versus the standard under securities law. Your comments are appreciated very much. Please circulate to the appropriate people in your building.

Give me a call if you need any further background.

# **Out of Sight, Out of Mind: The Effects of Expenses on Mutual Fund Flows\***

## **I. Introduction**

We analyze the fees charged by mutual funds over the last several decades. Mutual funds have dramatically changed the way that they charge expenses. The proportion of diversified U.S. equity mutual fund assets invested in front-end-load funds has dropped from 91% in 1962 to 35% in 1999 (see fig. 1). In contrast, asset-weighted operating expenses for these funds increased by more than 60%, from 54 basis points in 1962 to 90 basis points in 1999 (see fig. 2), despite the great increase in total assets under management. In addition to documenting these facts, which are

\* This paper was previously entitled "The Behavior of Mutual Fund Investors." We benefited from the comments of Nicholas Barberis, Shlomo Benartzi, Marshall Blume, William Goetzmann, Daniel Hirsch, John Rea, Brian Reid, Jason Zweig, and seminar participants at Duke, the NBER Behavioral Finance Group, UCLA, the Western Finance Association Meetings (June 2001), and the Conference on Distribution and Pricing of Delegated Portfolio Management (Wharton Financial Institutions Center May 2002). We are grateful to the discount brokerage firm that provided us with the data for this study. Zheng thanks Fang Cai and Michael Clare for excellent research assistance. All errors are our own.

*(Journal of Business, 2005, vol. 78, no. 6)*

0021 9398/2005/7806 0002\$10.00

We argue that the purchase decisions of mutual fund investors are influenced by salient, attention-grabbing information. Investors are more sensitive to salient, in-your-face fees, like front-end loads and commissions, than operating expenses; they buy funds that attract their attention through exceptional performance, marketing, or advertising. We analyze mutual fund flows over the last 30 years and find negative relations between flows and front-end-load fees. In contrast, we find no relation between operating expenses and flows. Additional analyses indicate that marketing and advertising, the costs of which are often embedded in funds' operating expenses, account for this surprising result.

FIG. 1. Mean Front End load fee and percentage of assets invested in funds with front end loads for U.S. diversified equity mutual funds, 1962-99. Front end load fees are from the CRSP mutual fund database. The mean load fee is based only on funds charging a front end load and is weighted by fund size.

FIG. 2. Mean operating expense ratio for U.S. diversified equity mutual funds, 1962-99. The mean operating expense ratio is calculated based on expense ratios reported in the CRSP mutual fund database for U.S. diversified equity mutual funds and is weighted by fund size. Funds with zero expense ratios are excluded from the calculation of the mean. On average, 97% of assets are held in funds with nonzero expense ratios, ranging from 92% in 1987 to 100% in 1999.

interesting on their own, we argue that the most plausible explanation for this change over time is investor learning. Investors have learned by experience to avoid mutual fund expenses. However, they learned more quickly about front-end-load fees, which are large, salient, one-time fees, than operating expenses, which are smaller, ongoing fees that are easily masked by the volatility of equity returns.

When shopping for a mutual fund, investors can choose from thousands of funds, far more than any investor can carefully consider. Most investors have no formal training in what factors to weigh when selecting a fund. Academic finance advises investors that low fees are preferable to high fees, that past returns are poor predictors of future returns in the long run, and that there is little, or no, evidence that active managers can outperform indices. Thus, investors would be best off choosing any well-diversified mutual fund with low fees (e.g., an index fund).

Over the last three decades, mutual fund investing has increased dramatically.<sup>1</sup> Investors, in aggregate and individually, have had the opportunity to learn about mutual funds and to change the ways in which they weigh various factors when buying funds. Funds, too, have had the opportunity to adapt to a changing marketplace.

In this paper, we focus on changes in how investors treat various mutual fund expenses, that is, front-end-load fees, commissions, and operating expenses. We contend that, over time, investors have become increasingly aware of and averse to mutual fund costs. However, they have learned more quickly to avoid high front-end-load and commission costs than high operating expense costs.

We argue that front-end loads are more salient than operating expenses. Front-end-load fees are paid when a fund is purchased and generally obvious in nominal terms on the first statement following the transaction (load fees are approximately the difference between the amount initially invested in the fund and the fund value on the first monthly statement). Therefore, front-end-load fees are transparent and thus salient, in-your-face expenses. While the salience of these expenses may come too late for first-time fund investors (e.g., may coincide with first monthly statement), it is likely to be remembered when they buy again. Thus, we hypothesize that investors have learned to avoid front-end-load funds by experience. We test this hypothesis in two ways. First, we use fund flows data from 1970 to 1999 to estimate cross-sectional regressions of fund flows on front-end-load fees and other fund characteristics. Consistent with our hypothesis, we find a significant negative relation between fund flows and front-end-load fees. Second, using brokerage account data pulled from the trades of 78,000 households from

1. For example, from 1989 to 1998, the percentage of households owning mutual funds nearly doubled from 7.1% to 16.2%. In contrast, the percentage of households owning stock directly increased from 16.2% to 19.2% (Kennickell and Starr McCluer (1994, 2000)).

1991 to 1996, we contrast first-time mutual fund purchases with repeat mutual fund purchases. The results of this test provide direct evidence of learning; experienced fund purchasers pay, on average, about half the front-end-load fees of first time purchasers.

Operating expenses are less salient than loads. While operating expenses constitute a steady drain on a fund's performance, the effect of that drain is masked by the considerable volatility in the returns on equity mutual funds.<sup>2</sup> Thus, we hypothesize that investors are less likely to avoid funds with high operating expenses. Using fund flows data from 1970 to 1999 and cross-sectional regressions, we document that there is at best no relation, and at worst a perverse positive relation, between fund flows and operating expenses. Using brokerage data from 1991 to 1996, we find virtually no difference between the operating expenses of first-time fund purchases and repeat fund purchases.

Our analyses help to inform ongoing policy discussions regarding how mutual fund expenses should be disclosed to investors. The implicit assumption underlying this debate is that mutual fund investors are sensitive to the form in which fund expenses are disclosed to investors. For example, in June 2000, the General Accounting Office (GAO) issued the following recommendation:

Although most industry officials that the GAO interviewed considered mutual fund disclosures to be extensive, others, including some private money managers and academic researchers, indicated that the information currently provided does not sufficiently make investors aware of the level of fees they pay. These critics have called for mutual funds to disclose to each investor the actual *dollar amount* of fees paid on their fund shares. Providing such information could reinforce to investors the fact that they pay fees on their mutual funds and provide them information with which to evaluate the services their funds provide. In addition, having mutual funds regularly disclose the dollar amounts of fees that investors pay may encourage additional fee-based competition that could result in further reductions in fund expense ratios. GAO is recommending that this information be provided to investors.

In December 2000, the Securities and Exchange Commission issued a report recommending "that information about the *dollar amount* of [mutual fund] fees and expenses be presented in a fund's shareholder reports."

Both front-end-load fees and operating expenses are used to pay for marketing (e.g., distribution payments to brokers or advertising). We do not contend that load fees spent on marketing are less efficacious than

2. Mutual funds report returns net of operating expenses. This may cause investors to be less sensitive to operating expenses than if operating expenses and gross returns were reported separately. Thaler (1985) shows that, in general, people are less sensitive to losses (e.g., operating expenses) when those losses are aggregated with other losses (e.g., negative gross fund returns) or with larger gains (e.g., gross fund returns in excess of expenses).

operating expenses spent on marketing. Rather, we believe that over time investors have learned more quickly to avoid salient load fees than obfuscated operating expenses. While virtually all front-end-load fees are used for marketing, operating expenses can be disaggregated into 12B-1 fees (fees earmarked for marketing) and other operating expenses. We find the significant positive relation between flows and expenses is confined to 12B-1 fees. Thus, all else equal, investors do not prefer to buy mutual funds with high operating expenses, but they do buy funds that attract their attention through advertising and distribution. In short, consistent with the findings of Jain and Wu (2000), mutual fund advertising works.

After discussing related literature, we describe our data, present results, and conclude.

## **II. Related Literature**

Several academic studies have documented a negative relation between a fund's operating expense ratio and performance (e.g., Gruber 1996 and Carhart 1997). Thus, it is sensible for investors to eschew the purchase of funds with high operating expenses. Generally, investors pay fees to mutual funds through operating expense ratios applied to assets under management or through load fees charged when investors purchase (or less commonly sell) a mutual fund. When purchasing funds through a broker, investors pay a commission to the broker for some mutual funds, but not for others, which are designated as nontransaction fee (NTF) funds.

Survey and experimental evidence support our contention that mutual fund investors are generally unable to assess the trade-off between different fees charged by mutual funds. Wilcox (2003) presents 50 consumers who currently invest in mutual funds with profiles of stock mutual funds with different expense ratio and load combinations. He documents that 46 of the 50 study participants overemphasized loads relative to expense ratios. Alexander, Jones, and Nigro (1998) document that less than 20% of 2,000 surveyed mutual fund investors could give an estimate of the expenses incurred for their largest mutual fund holding. Furthermore, despite empirical evidence to the contrary, 84% of respondents believed that mutual funds with higher expenses earned average or above average returns.

Surprisingly little empirical research has been done on how investors consider expenses when investing in mutual funds. The only empirical work that we are aware of is Sirri and Tufano (1998), who document a negative relation between fund flows and total fund expenses (amortized front-end-load fees and operating expenses).

We fill this void in the empirical literature by analyzing new money flowing into mutual funds from 1970 through 1999. When we separate front-end-load fees and expense ratios, we find strong evidence that investors treat the two differently. In both univariate and multivariate

analyses, we document a significant negative relation between fund flows and front-end-load fees, but no relation, or a positive one, between fund flows and operating expenses. When we disaggregate operating expenses into 12B-1 fees and other operating expenses for the limited sample period for which we have 12B-1 fee data (1993–99), we find the significant positive relation between flows and expenses confined to 12B-1 fees.

### III. Data

We obtained data on mutual funds from the Center for Research in Security Prices (CRSP) mutual fund database. Consistent with many prior mutual fund studies, we restricted our analysis to diversified U.S. equity mutual funds.<sup>3</sup> Thus, we exclude from our analyses bond funds, international equity funds, and specialized sector funds. The number of funds meeting these data requirements grew over time. In 1970, 465 funds met these requirements, while in 1998, 3,533 funds met these requirements.

We analyze the period 1970 through 1999, since the CRSP database reports total net assets (TNA) on a quarterly basis beginning in 1970. Consistent with prior research, we calculate new money as a percentage of beginning-of-period TNA as

$$\frac{TNA_{it} - TNA_{i,t-1}(1 + R_{it})}{TNA_{i,t-1}},$$

where  $R_{it}$  is the return of fund  $i$  in period  $t$ . Essentially, this is a percentage growth in new money during period  $t$ . Here we assume that new money flows in and out of each fund at the end of each period since we do not know the exact timing of cash flows. For some analyses we use quarterly growth, while for others we use annual growth. The median mutual fund experiences annual growth of 5.3% and quarterly growth of 1.2%. There is considerable cross-sectional variation in growth. The interquartile range is 21 to 51% for annual growth and 3 to 11% for quarterly growth. High growth in new money relative to other funds generally leads to a greater market share.<sup>4</sup>

3. We selected funds according to the following criteria. First, we selected funds with the following Investment Company Data, Inc. (ICDI) objectives: aggressive growth, growth and income, long term growth, or total return (only if they have the following Strategic Insight's fund objectives: flexible, growth, or income growth). If ICDI objectives are missing, we select funds with the following Strategic Insight's fund objectives: aggressive growth, growth and income, growth, income growth, or small company growth. If both ICDI and Strategic Insight's objectives are missing, we select funds with the following Weisenberger fund types: AAL, AGG, G, G I, G I S, G S, G S I, GCI, GRI, GRO, I G, I G S, I S, I S G, MCG, SCG, or TR. If all three of these criteria are missing, we select funds described as common stock funds according to the policy and objective codes.

4. There are obviously exceptions to this general relationship. For example, a fund with strong performance and negative growth in new money might lose market share clearly an unusual occurrence since it is well documented that the highest growth in new money occurs for funds with strong performance.

## IV. Results

### A. Univariate Sorts

Our primary focus is the relation between different forms of expenses and the growth of new money. We begin by presenting basic descriptive statistics for two partitions of our data. In the first partition, we construct deciles on the basis of expense ratios; in the second partition, we compare funds with front-end loads to those without front-end loads. For each partition, we calculate mean expense ratios, front-end-load fees, and TNA for the sorting year, while we calculate the annual growth of new money and fund returns during the following year.

We calculate the mean monthly return for funds in each partition and two performance measures: the capital asset pricing model (CAPM) alpha and a three-factor alpha. These performance measures are based on the time-series of mean monthly returns for mutual funds within a partition ( $R_{pt}$ ), where funds are reassigned to partitions annually. The CAPM alpha is the intercept from the following time-series regression:

$$(R_{pt} - R_{ft}) = \alpha + \beta(R_{mt} - R_{ft}) + \varepsilon_t,$$

where

- $R_{ft}$  = the monthly return on T-bills,<sup>5</sup>
- $R_{mt}$  = the monthly return on a value-weighted market index,
- $\alpha$  = the CAPM intercept (Jensen's alpha),
- $\beta$  = the market beta, and
- $\varepsilon_t$  = the regression error term.

The Fama-French alpha is the intercept from the three-factor model developed by Fama and French (1993):

$$(R_{pt} - R_{ft}) = \alpha + \beta(R_{mt} - R_{ft}) + sSMB_t + hHML_t + \varepsilon_t,$$

where  $SMB_t$  is the return on a value-weighted portfolio of small stocks minus the return on a value-weighted portfolio of big stocks and  $HML_t$  is the return on a value-weighted portfolio of high book-to-market stocks minus the return on a value-weighted portfolio of low book-to-market stocks.<sup>6</sup> The regression yields parameter estimates of  $\alpha$ ,  $\beta$ ,  $s$ , and  $h$ . The error term in the regression is denoted by  $\varepsilon_t$ .

The results of this analysis are presented in table 1. In panel A, we present results for mutual funds sorted into deciles on the basis of

5. The return on T bills is from *Stocks, Bonds, Bills, and Inflation, 2000 Yearbook*, Ibbotson Associates, Chicago.

6. The construction of these portfolios is discussed in detail in Fama and French (1993). We thank Kenneth French for providing us with these data.

NOTE. In panel A, funds are sorted into deciles on the basis of operating expense ratios in year  $t-1$  from 1969-1998. In panel B, funds are sorted into deciles on the basis of front-end-load fees in year  $t-1$  from 1969 to 1998. The table presents the number of funds, mean expense ratio, front-end-load fee, and mean TNA in sorting year ( $t-1$ ). New money as a percentage of TNA and the equally weighted mean monthly return for each performance decile are for the subsequent year ( $t$ ). The CAPM alpha is the intercept from a monthly time-series regression of the mean monthly excess return for each sample partition on the market excess return. The Fama-French alpha is the intercept from a monthly time-series regression of the mean monthly excess return for each sample partition on the market excess return, a zero-investment portfolio formed on the basis of firm size, and a zero-investment portfolio formed on the basis of book-to-market ratios.

\*\* , \* Significant at the 5% or 10% level, two-tailed test.

expense ratios, while panel B contrasts front-end-load and no-front-end-load funds. Load fees and operating expenses are not perfect substitutes. Although low expense funds have higher front-end-load fees than high expense funds, the relation between expenses and front-end loads is far from monotonic. In addition, front-end-load funds have higher average expense ratios than funds without front-end loads. Clearly, investors could choose a fund with no front-end load and low expenses. For example, in May 2002, the Vanguard 500 Index fund charged no front-end load and sported an expense ratio of 18 basis points.

Funds with low expense ratios are dramatically larger than funds with high expense ratios. For example, the funds in the lowest expense decile represent 36% of assets in mutual funds, while funds in the highest expense decile represent only 1%. This is consistent with the evidence in Khorana and Servaes (2000), who document fund families with low expenses have a higher market share than fund families with higher expenses. Low expenses may attract investors, or new money may lead to economies of scale that allow funds to lower expenses. Thus, it is unclear whether low expenses lead to a greater market share or a greater market share leads to lower expenses.

If low expenses lead to a greater market share, we would expect growth rates to be higher for funds with low expenses. This is not the case during our sample period. In fact, our crude univariate sorts indicate a nearly monotonic positive relationship between expenses and growth rates. Funds with high expenses have the highest growth rates. In contrast, funds without front-end loads, which tend to be smaller than front-end-load funds, enjoy higher growth rates.

In the last three columns of table 1, we present the mean monthly returns for each partition, the CAPM alpha, and the Fama-French alpha. Although there is no discernible relationship between performance and expenses for the majority of funds, investors clearly pay a large price for investing in funds with the highest expenses. These funds underperform by an economically large margin (26 to 37 basis points per month).<sup>7</sup> Furthermore, the returns on front-end-load funds are not significantly different from the returns on other funds. Thus, these results confirm the conventional wisdom that investors should spurn funds with front-end loads or high expenses.

### *B. Multivariate Analyses*

The results based on univariate sorts are insufficient evidence to draw strong conclusions about the relationship between new money and operating expenses or front-end-load fees. It is possible that the univariate

7. During our sample period, the CAPM alpha for the average diversified U.S. equity mutual fund is 0.10% per month, while the Fama French alpha is 0.02% per month. Neither figure is reliably different from zero.

relationships are driven solely by mean reversion in market share over time: small funds, which have high expense ratios, gain market share, while large funds, which have low expense ratios, lose market share.

To address this possibility, we estimate a series of cross-sectional regressions. The dependent variable in these regressions is the quarterly net flow scaled by beginning of quarter TNA for each diversified U.S. equity mutual fund from the first quarter of 1970 to third quarter of 1999.<sup>8</sup> For each quarter, we regress this dependent variable on a series of independent variables, which we describe next. Test-statistics are based on the time series of coefficient estimates across the 119 quarters. Note that our dependent variable measures changes in investor buying behavior over time. For example, if flow scaled by TNA is negatively related to front-end-load fees, then investors are putting relatively less money into front-end-load funds over time.

To control for the effect of performance on fund flows, we include the annual market-adjusted returns on the fund during each of the 2 years preceding quarter  $t$  as independent variables in the regressions. The annual market-adjusted return is the annual fund return less the annual return on the CRSP NYSE/ASE/NASDAQ value-weighted index. We include squared market-adjusted returns for each of the previous 2 years to capture the well-documented nonlinear relation between performance and fund flows (Sirri and Tufano 1998; Chevalier and Ellison 1997). We also include a fund's monthly return standard deviation (measured over the 2 years leading up to quarter  $t$ ), as an independent variable in the regression. Monthly return standard deviation measures the short-term volatility of a fund. All independent variables in the regressions are from the CRSP mutual fund database.<sup>9</sup>

Our primary focus is the relation between fund flows and expenses. First, we replicate the results of Sirri and Tufano (1998) by calculating total expenses for each fund. As in Sirri and Tufano (1998), total expenses are defined to be the operating expense ratio plus one-seventh of the percentage front-end-load fee, if any.<sup>10</sup> This calculation assumes that an investor in a load fund would hold the fund for 7 years, thus

8. To reduce the effect of outliers on the coefficient estimates, we winsorize the dependent variables at the ninety ninth percentile. Our results are qualitatively similar when we include these outliers. We also exclude 26 funds that were closed to new investment during our sample period. Fund closing data are from CRSP. These funds are excluded in the year of closing and all subsequent years.

9. The CRSP mutual fund database reports zero operating expenses and turnover for a large number of funds. Based on our discussions with CRSP, zero operating expenses likely indicate missing information. Thus, we exclude funds with either zero operating expenses from these analyses. From 1990 to 1995, CRSP reports nonzero operating expense ratios for 87% of funds.

10. We exclude back end load fees from our calculation of total expenses for two reasons. First, data on back end loads is not available in the CRSP database prior to 1993. (The post 1993 data on back end loads also often reports a redemption fee as a back end load.) Second, back end loads are often waived if an investor holds a fund for a specified period of time.

amortizing the front-end-load fee over that holding period. This regression specification obviously assumes that investors respond similarly to load fees and expense ratios. To test our conjecture that they do not, we then estimate regressions that include operating expenses and front-end-load fees as separate independent variables. We include a dummy variable that takes on a value of 1 if a fund is in the highest expense decile, since it is among these funds where high expenses extract the largest performance penalty. To control for the possibility that fund families are steering money into new funds (with lower front-end loads and higher operating expenses) and thus creating a spurious correlation between loads and growth, we include the log of fund age as an independent variable. We also estimate these regressions excluding funds less than 5 years old. Since we are concerned that our results might be driven by small funds, we include the log of total net asset value as an independent variable. We also estimate these regressions in each quarter for the 50 mutual funds with the largest beginning-of-quarter TNA and estimate regressions excluding the smallest 30% of funds in our sample.

In a plausible equilibrium, we would expect no relation between fund flows and any of our expense variables. For example, one group of investors might reasonably prefer front-end-load funds with low expenses, while a second group of investors might reasonably prefer no-load funds with higher expenses. Assuming the preferences of the two groups do not change over time and the wealth of the two groups grows similarly over time, expenses and loads would be unrelated to fund flows. Thus, the coefficient estimates on our expense variables from the cross-sectional regressions are tests of changing preferences over time. We hypothesize that investors have learned to avoid front-end-load funds but not operating expenses. Thus, we predict a stronger negative relation between front-end-load fees and flows than between operating expenses and flows.

The results of this analysis are presented in table 2. Consider first the results for the control variables. The coefficient estimates on the return variables are consistent with the nonlinearity in the relationship between performance and fund flows. The cross-sectional standard deviation of market-adjusted returns for mutual funds is roughly 10%. Thus, our regression estimates for all funds indicate that a fund that beats the market by 10% (roughly a one standard deviation event) experiences growth of 5% (e.g., using coefficients from the second column of table 2,  $0.393*0.1 + 1.01*0.1^2 \approx 0.05$ ), while a fund that lags the market by 10% shrinks by 3%. A fund that beats the market by 20% experiences growth of 12%, while a fund that lags the market by 20% shrinks by only 4%. Consistent with the evidence in Chevalier and Ellison (1997), these patterns are less pronounced for larger and older funds. There is a negative relationship between monthly volatility and flows. Small funds

NOTE. This table reports the mean coefficient estimates and associated  $t$ -statistics (in parentheses) from cross-sectional regressions of fund flows on selected fund characteristics from the first quarter of 1970 to the third quarter of 1999. The dependent variable is the quarterly net fund flows scaled by the beginning of quarter TNA. The independent variables include total expenses (TX, operating expenses plus one-seventh of a fund's front-end-load fee), operating expenses (X), front load (L), a dummy variable which takes a value of 1 if the fund appeared in the highest expense decile in year  $t-1$  (high-expense dummy), the annual market-adjusted fund return for the previous 12 months (MAR), the annual market-adjusted fund return for the 12 months in year  $t-2$ , the annual adjusted fund returns squared for years  $t-1$  and  $t-2$ , the monthly standard deviation of the fund's return over the previous 24 months, log of beginning-of-quarter TNA, and log of fund age. The dependent variable is winsorized at the ninety-ninth percentile. Funds closed to new investors are excluded from the analyses at the time and after they became closed. Test statistics (in parentheses) are based on the time series of coefficient estimates across 119 quarters.

\*\*\*, \*\*, \* Significant at the 1%, 5%, or 10% level, two-tailed test.

experience higher growth rates, although this relation reverses when we analyze only the largest 50 funds. Older funds also experience lower growth rates than younger funds.

There is a significant negative relation between total expenses and fund flows, consistent with the results reported by Sirri and Tufano (1998). This relation holds for all funds, although the economic significance of the relation is modest. A 100 basis point decrease in total expenses is associated with 0.39% growth in new money. The results of our remaining analyses are generally consistent with this negative but economically small relation between total expenses and flows.

However, when we include operating expenses and front-end-load fees as separate independent variables in the regression, the negative relation between total expenses and flows is clearly driven by a significant negative relation between front-end load fees and flows. For all funds, there is no relation between operating expenses and flows, while for the largest 50 funds, the largest 70% of funds, and funds older than 5 years there is a positive relation. This evidence indicates that the results from the univariate sorts presented previously are not driven solely by small or young funds. Thus, consistent with our hypothesis that investors respond differently to different expenses, we document a significant negative relation between flows and front-end loads. In contrast, there is, at best, no relation between operating expenses and flows and, at worst, a perverse positive relation between expenses and flows for large funds.<sup>11</sup>

### *C. The Role of Advertising*

The lack of relation between expense ratios and fund flows suggests that mutual funds can raise operating expense ratios with impunity. This is not the case. Mutual fund managers have a choice between pocketing expenses or spending on marketing. In this section, we present evidence that expenditures on marketing can largely explain the lack of relation between expense ratios and fund flows.

Mutual funds can take out up to 1.25% of average daily fund assets each year to cover the costs of selling and marketing shares, an arrangement allowed by the SEC's Rule 12B-1, which was passed in 1980. CRSP provides data on these so-called 12B-1 fees beginning in 1993.

11. A significant portion of cash flows to mutual funds come from employee sponsored retirement plans. These cash flows also tend to be persistent, as investors in employee sponsored retirement plans do not change their fund allocations regularly. Although we are unable to identify the source of funds in the analyses that rely on aggregate flows using CRSP data, we later analyze flows at brokerage accounts that do not include employee sponsored retirement plans. Similar to the results discussed here, we find a negative relation between front end loads and flows but no reliable relation between operating expenses and flows. Furthermore, these results are similar when we separately identify flows in taxable accounts and tax deferred accounts (e.g., 401k and Keogh).

For the period 1993–99, we are able to separately identify fees devoted to the selling and marketing of shares (12B-1 fees) and other fees (non-12B-1 fees). We augment our regression analysis by including these two variables separately as independent variables in the regression.

We suspect that both front-end-load fees and 12B-1 fees are spent in the manner that the fund managers believe will best attract fund flows. We anticipate that fund flows will be positively related to 12B-1 fees because the positive effects on flows of marketing will dominate the negative effects of fees charged as operating expenses; fund flows will be less positively related to front-end loads because the positive effects on flows of spending front-end-load fees on marketing will be at least partially offset by the negative effect of loads being salient to investors; and fund flows will be negatively related to non-12B-1 operating fees because the negative effect of fees is not, here, offset by marketing.

The results of this analysis are presented in table 3. To provide a baseline for comparison, we also include results for total expenses. Because of the reduced sample period, the power of the empirical tests is diminished; for example, the relation between total expenses and fund flows is no longer reliably negative.

When operating expenses are separated into 12B-1 and non-12B-1 fees, the coefficient estimates for 12B-1 fees are reliably positive for all funds, for the large funds, and for older funds; the coefficient estimates for non-12B-1 fees are negative, although not statistically significant for the largest 50 funds and funds over 5 years old; and the coefficient estimates for front-end-load fees always lie between those of 12B-1 and non-12-1 fees.<sup>12</sup>

Advertising works. Funds with higher expenditures on 12B-1 fees garner more new money. This result is consistent with the findings of Jain and Wu (2000), who document that 294 mutual funds that advertised in *Barron's* or *Money* magazine grew faster than a control group of funds with similar performance prior to the advertising period.

A natural question that arises from this discussion is whether the long-run increase in operating expenses can be solely explained by increasing expenditures on 12B-1 fees as a result of the emergence of many new funds and mutual fund supermarkets. This is a plausible conjecture, as more and more funds compete to be heard above the din of mutual fund advertising. Consistent with this conjecture, from 1993 to

12. Operating expenses are paid annually, while load fees are a one time expense and thus should be amortized over an investor's holding period for comparison purposes. Thus, the comparison of the coefficient estimates on front end load fees should be divided by the relevant holding period. Using any reasonable holding period, the coefficient estimates on loads always fall between those of non 12B 1 expenses and 12B 1 expenses. Indeed, despite a much shorter time series and, thus, less powerful tests, we can comfortably reject the null hypothesis that flows are equally sensitive to 12B 1 fees and load fees for all funds, the largest 50 funds, and the largest 70% of all funds.

NOTE. This table reports the mean coefficient estimates and associated  $t$ -statistics (in parentheses) from cross-sectional regressions of fund flows on selected fund characteristics from the first quarter of 1993 to the third quarter of 1999. The dependent variable is the quarterly net fund flows scaled by the beginning of quarter TNA. The independent variables include total expenses (TX, operating expenses plus one-seventh of a fund's front-end-load fee), front load ( $L$ ), a dummy variable which takes a value of 1 if the fund appeared in the highest expense decile in year  $t-1$  (high-expense dummy), non-12B expenses, 12B expenses, the annual market-adjusted fund return for the previous 12 months (MAR), the annual market-adjusted fund return for the 12 months in year  $t-2$ , the annual adjusted fund returns squared for years  $t-1$  and  $t-2$ , the monthly standard deviation of the fund's return over the previous 24 months, log of beginning-of-quarter TNA, and log of fund age. The dependent variable is winsorized at the ninety-ninth percentile. Funds closed to new investors are excluded from the analyses at the time and after they became closed. Test statistics (in parentheses) are based on the time series of coefficient estimates across 27 quarters.

\*\*\*, \*\*, \* Significant at the 1%, 5%, or 10% level, two-tailed test.

1999 the mean (TNA-weighted) 12B-1 fee charged by mutual funds increased from 0.139% to 0.202%. (There was also a marked increase in the proportion of funds charging 12B-1 fees during this period, from 34% of all funds in 1993 to 57% of all funds in 1999.) However, from 1962 to 1999, the mean (TNA-weighted) operating expense increased by 35 basis points. Thus, increased expenditures on 12B-1 fees, though they may have contributed to the long-run increase in operating expenses, cannot totally explain the increase.

#### *D. Mutual Fund Commissions*

With the exception of front-end-load fees, mutual fund investors can generally purchase mutual funds directly from the fund complex at zero transaction costs. However, many mutual funds are traded through mutual fund marketplaces at major brokerage firms. When purchasing mutual funds through a broker, a commission is charged for the purchase or sale of some funds, but not others. Generally fund complexes will pay a fee to the broker to gain status as a nontransaction fee fund. Laplante (2001) documents that funds traded with NTF status on marketplaces have expense ratios that are 17 to 19 basis points higher than funds not available in the marketplaces.<sup>13</sup> We hypothesize that commissions, like load fees, are salient expenses for many investors and thus expect that funds with NTF status will garner more new money, despite higher average operating expenses.

To test this hypothesis, we analyze the mutual fund purchase and sale decisions of households with accounts at one nationwide discount broker. The data span the period 1991 through 1996 (see Barber and Odean 2000 for a more complete description of these data). Of the 78,000 sampled households, 32,199 (41%) had positions in mutual funds during at least 1 month; the remaining households held either cash or investments in securities other than mutual funds. For the 78,000 households, 17% of all market value was held in mutual funds and 64% in individual common stocks. There were over 3 million trades in all securities. Mutual funds accounted for 18% percent of all trades; individual common stocks accounted for 64%. By virtue of being bought or sold through one brokerage, all of the funds traded in this sample are part of that brokerage's mutual fund "supermarket," but not all funds in the supermarket have NTF status. In our sample, 76% of fund purchases and 49% of sales are NTF funds.

13. Ciccotello, Greene, and Walsh (2003) analyze funds traded in a supermarket and those that are not. They document that the mean expense ratios of funds traded in marketplaces are similar to those not traded in a marketplace. They also find that funds do not increase their expense ratios or the 12B 1 fees after they join an NTF supermarket. In contrast, the conclusions of Laplante (2001) are based on a multivariate regression of operating expenses on fund characteristics.

Of the 32,199 households with positions in mutual funds, the average held 3.6 mutual funds worth \$36,988. Both of these numbers are positively skewed. The median household held two mutual funds worth \$12,844 dollars. For these households, the positions in mutual funds and individual common stocks were roughly equal. Forty-two percent of the market value in these accounts was held in mutual funds and 39% in individual common stocks. In aggregate, these households held 1,073 mutual funds worth \$1.4 billion in December 1996.

For each fund ( $i$ ) in each month ( $t$ ), we estimate new money as the value of buys ( $B$ ) less the value of sells ( $S$ ) scaled by beginning of month total net assets (TNA):  $(B_{it} - S_{it})/TNA_{i,t-1}$ . Unlike that in the aggregate case, here we know the exact amount and timing of new money. As before, we estimate cross-sectional regressions for each month then average coefficient estimates across months. We also include a dummy variable that takes on a value of 1 if a fund can be traded without a commission (a nontransaction fee fund).<sup>14</sup>

The results of this analysis are presented in table 4. Consistent with our prior results, we find either no relation or a positive relation between funds' operating expenses and new money for these households. Also consistent with our prior evidence, we find a significant negative relation between front-end-load fees and new money.

The primary variable of interest—the NTF dummy—is consistently positive for all eight regressions and significant for six of these. NTF funds garner significantly more new money than funds for which investors pay a commission to buy or sell. Commissions are salient, one-time expenses to which investors attend.

#### *E. Experienced versus First-Time Mutual Fund Buyers*

We contend that front-end-load fees are more obvious and salient to investors than operating expense fees. We believe that a large, one-time fee is more likely to capture an investor's attention than a smaller, ongoing expense. Both loads and fees are usually quoted in percentage terms. However, the dollar cost of a front-end load is likely to be obvious when an investor receives the first fund statement (i.e., approximately the difference between the amount invested and the first statement balance). The immediate effect of operating expenses on the investor's principal is small and the subsequent drain of operating expenses on return is likely to be masked by fund volatility. An important implicit assumption in our argument is that investors learn by experience and they learn more quickly about salient load fees than the less obvious operating expenses. We are able to test this hypothesis directly using the discount brokerage account data.

14. We define a fund as a nontransaction fee fund if more than 90% of the trades in the fund were executed without a commission during our sample period.

**TABLE 4** Cross Sectional Regressions of Monthly New Money from Discount Brokerage Accounts, 1991-96

NOTE. This table reports the mean coefficient estimates and associated *t*-statistics (in parentheses) from cross-sectional regressions of fund flows based on the account transaction data from a U.S. discount brokerage firm on selected fund characteristics from January 1991 to November 1996. The dependent variable,  $(B_{it} - S_{it})/TNA_{i,t-1}$ , is the total value of buys less the total value of sells for fund *i* scaled by the beginning-of-month TNA. The independent variables include total expenses (TX), operating expenses plus one-seventh of a fund's load fee), operating expenses (*X*), front load (*L*), a dummy variable which takes a value of 1 if the fund appeared in the highest expense decile in year *t* (high-expense dummy), the annual market-adjusted fund return for the previous 12 months (MAR), the annual market-adjusted fund return for the 12 months in year *t* - 2, the annual adjusted fund returns squared for years *t* - 1 and *t* - 2, the monthly standard deviation of the fund's return over the previous 24 months, log of beginning-of-quarter TNA, and log of fund age. The dependent variable is winsorized at the ninety-ninth percentile and is multiplied by 1 million. Funds closed to new investors are excluded from the analyses at the time and after they became closed. Test statistics (in parentheses) are based on the time series of coefficient estimates across 72 months.

\*\*\*, \*\*, \* Significant at the 1%, 5%, or 10% level, two-tailed test.

**TABLE 5** Mean Characteristics of First Mutual Fund Purchases (19,056) versus Subsequent Purchases (188,506) from Discount Broker Trades Data, 1991-96

|                             | First Purchases | Subsequent Purchases | Difference      |
|-----------------------------|-----------------|----------------------|-----------------|
| Total expenses (%)          | .95             | .95                  | .00 (.82)       |
| Operating expenses (%)      | .93             | .94                  | .01** ( 2.18)   |
| Front end load fees (%)     | .111            | .061                 | .05*** (10.69)  |
| NTF status (%)              | 39.67           | 39.09                | .58 (1.57)      |
| Fund MAR <sub>t-1</sub> (%) | 7.16            | 5.58                 | 1.57*** (14.22) |
| Fund MAR <sub>t-2</sub> (%) | 6.14            | 5.00                 | 1.14*** (10.46) |

NOTE. Descriptive statistics are for 19,056 first mutual fund purchases of households and 188,506 subsequent purchases. Data are from trades made at a large discount broker from 1991 through 1996. Variables include total expenses (operating expenses plus one-seventh of a fund's load fee), operating expenses, front load, nontransaction fee (NTF) status at the broker, the annual market-adjusted fund return for the previous 12 months (MAR), and the annual market-adjusted fund return for the 12 months in year  $t - 2$ . The  $t$ -statistics are in parentheses.

\*\*\*, \*\* Significant at the 1% and 5% level, respectively (two-tailed test).

Many investors purchase more than one mutual fund in their life. If we are correct in our contention that load fees are more salient than operating expenses and investors learn over time, then we would expect repeat buyers to demonstrate more aversion to loads than first-time buyers and more aversion to loads than operating expenses. Table 5 reports descriptive statistics for first-time fund purchases and subsequent fund purchases by investors in our large discount brokerage data set.<sup>15</sup> Our estimate of total expenses is unchanged for first-time and subsequent purchases. Experienced fund buyers have a small, but statistically significant, tendency to buy funds with higher operating expenses. As we anticipated, experienced buyers choose funds with much lower loads than first-time buyers: 0.06% for experienced buyers vs. 0.11% for first-time buyers. Experienced buyers also put apparently less weight on a fund's previous returns than first-time buyers.

To test the robustness of these results, we separately analyze the three major fund categories in our dataset: aggressive growth, growth and income, and long-term growth. In each of these three fund categories, the front-end loads paid by first-time buyers are reliably greater than those paid by experienced buyers. In contrast, the pattern for operating expenses is not consistent across these three fund categories; the operating expenses paid by first-time buyers is lower for aggressive growth and growth and income funds but higher for long-term growth funds.

15. We categorize purchases as first time if the investor has not previously purchased a fund at this brokerage during our sample period. Obviously, some purchases categorized as first time were made by investors who had previously purchased funds elsewhere or before our sample period. Purchases incorrectly labeled first time will only make it more difficult to distinguish differences in the characteristics of funds actually purchased for the first time and other funds.

### *F. Changes in Expenses*

We find evidence that mutual fund investors pay attention to salient, in-your-face fees like front-end loads and commissions, while they attend less to operating expense ratios. Yet low expense mutual funds have greater average market share than high expense mutual funds. Our results indicate that the high market share enjoyed by low expense funds is not a result of new money flowing into low expense funds. Low expense funds may have greater average market share because fund growth leads to lower expenses; indeed, many mutual fund prospectuses prescribe reductions in operating expenses as assets under management grow. In this section, we present empirical evidence consistent with this conjecture.

To test whether funds lower expenses as they grow, we calculate the change in operating expenses for all funds, the 50 largest funds, the largest 70% of funds, and funds older than 5 years. Assets under management can grow by attracting new money or posting strong returns. Since mutual funds enjoy economies of scale (Baumol et al. 1990), increased assets under management would allow funds to lower expenses. In each year, we regress the change in operating expenses on new money received in the prior 2 years and the fund's raw return in the prior 2 years. We include the raw return squared, since it is unlikely that economies of scale are linearly related to fund size. We include changes in front-end-load fees as an independent variable, since some funds may increase expenses when they lower or eliminate a front-end-load fee. Fund size and the monthly standard deviation of fund returns are also included as control variables.

The results of this analysis are presented in table 6. For all funds, the largest 70% of funds, and funds older than 5 years, there is strong evidence that growth leads to lower expenses for mutual funds. New money and strong returns lead to lower expenses. For example, the coefficient estimate for all funds of 0.00591 on a fund's prior year return indicates that a 10% return is associated with an average decrease in the expense ratio of 6 basis points in the following year. When we restrict our analysis to the 50 largest funds, we find no evidence that new money or fund performance predicts expense changes. This is not surprising, since large funds already enjoy economies of scale.

### **V. An Alternative Hypothesis: Search Costs and Service**

A possible alternative explanation for our results is search costs. Perhaps investors find it extremely costly to search for mutual funds. Thus, rather than incur the hassle of finding a fund, they merely invest in funds that come to their attention through advertising. In short, these investors knowingly sacrifice performance (i.e., the cost of advertising, which is a net drain on fund performance) to reduce the hassle of picking a mutual fund.

We believe attention influences investors' choices of mutual fund just as it influences their choices of stocks (Barber and Odean 2003). We do

**TABLE 6** Cross Sectional Regressions of Annual Expense Changes on Fund Characteristics, 1970-99

NOTE. This table reports the mean coefficient estimates and associated *t*-statistics (in parentheses) from cross-sectional regressions of annual expense changes on selected fund characteristics from 1970 to 1999. The dependent variable,  $X_t - X_{t-1}$ , is the change in expense ratios. The independent variables include change in front-end load fees (*L*), annual fund new money scaled by the beginning of year TNA (NM), the annual market-adjusted fund return for the previous 12 months (MAR), the annual market-adjusted fund return for the 12 months in year *t-2*, the annual adjusted fund returns squared for years *t-1* and *t-2*, the monthly standard deviation of the previous 24 months fund returns, log of TNA at the beginning of each quarter, and log of fund age. The new money variables are winsorized at the ninety-ninth percentile.

\*\*\*, \*\*, \* Significant at the 1%, 5%, or 10% level, two-tailed test.

not believe, however, that our results are driven solely by rational investors who, to minimize search costs, buy mutual funds that catch their attention. On the one hand, many—if not most—mutual fund investors do not minimize search costs. On the other hand, even when attention is not an issue, individuals overemphasize front-end loads relative to expense ratios. Several facts support this view.

First, Wilcox (2003) presents 50 consumers who currently invest in mutual funds with profiles of stock mutual funds with different expense ratio and load combinations. He documents that 46 of the 50 study participants overemphasize loads relative to expense ratios. There is clearly no search cost in this experimental design, yet he observes the same general patterns that we find in flow data.

Second, many investors actively trade mutual funds. In the brokerage account data that we use, mutual fund turnover exceeds 70% annually (which corresponds to a holding period of less than 18 months). In general, redemption rates for mutual funds are quite high, reaching 40%

**TABLE 7** Mean Characteristics of Mutual Fund Sales Followed by Mutual Fund Purchase within Three Weeks from Discount Broker Trades Data, 1991-96

|                             | Funds Bought | Funds Sold | Difference |         |
|-----------------------------|--------------|------------|------------|---------|
| Total expenses (%)          | .998         | .989       | .009**     | (2.44)  |
| Operating expenses (%)      | .983         | .963       | .021***    | (5.72)  |
| Front end load fees (%)     | .099         | .180       | .080***    | (10.44) |
| NTF status (%)              | 22.8         | 18.9       | 3.9***     | (9.09)  |

| Fund MAR <sub>t-2</sub> (%) | 4.97         | 4.93       | .04        | (.34)   |

NOTE. Descriptive statistics are for 14,862 mutual fund sales followed by a mutual fund purchase within 3 weeks. Data are from trades made at a large discount broker from 1991 through 1996. Variables include total expenses (operating expenses plus one-seventh of a fund's load fee), operating expenses, front load, nontransaction fee (NTF) status at the broker, the annual market-adjusted fund return for the previous 12 months (MAR), and the annual market adjusted fund return for the 12 months in year  $t-2$ . The  $t$ -statistics are in parentheses.

\*\*\*, \*\* Significant at the 1% and 5% level, respectively (two-tailed test).

in the late 1990s, which implies a holding period of 30 months.<sup>16</sup> If search costs loom large, we would expect investors to trade their mutual funds somewhat less often than they do.

Third, we can bring some data to bear on this issue. Using the brokerage data, we are able to identify mutual fund sales followed by mutual fund purchases within 3 weeks. It is unlikely that these sales were liquidity motivated, since they were followed by a purchase within 3 weeks. Although some of these sales might have been made to realize a tax loss, the average sale clearly was not, since the average fund sold outperformed the market (by more than 4% during a period when the market averaged more than 17% annually). Thus, it is likely that these sales followed by purchases were speculative in nature. It is worth noting that roughly half of all mutual fund sales in our brokerage data are followed by purchases within 3 weeks.

Clearly, the most straightforward way for investors who already own mutual funds to reduce search costs is to continue holding the mutual funds they already own. Yet, these investors do not do so. They willingly sell one fund to buy another. If the desire to minimize search costs were driving our findings then our findings would be dramatically different for these investors, who are clearly not minimizing search costs.

We present descriptive statistics on the funds bought and the funds sold in table 7. Consistent with our broad evidence, the average operating expense ratio of funds bought is slightly higher than that of funds sold, though the average front-end-load fee is lower. Investors are more likely to buy a fund with NTF status. Prior to the transaction, the funds bought

16. See "Vanguard Founder Targets Short Focus of Fund Firms," *Wall Street Journal* (May 16, 2000), p. C1.

had exceptional performance; the funds sold also beat the market, though by a much smaller margin.

In addition to search costs, investors might choose mutual funds with high expenses if high expense funds provided better service than other funds. We believe that different levels of service are unlikely to explain our results since first-rate service and low expenses are not mutually exclusive. For example, Vanguard, which is well-known for its low-cost mutual fund offerings, has won numerous service awards.<sup>17</sup>

## VI. Conclusions

Investing is a learning process. Over the last several decades investors have learned about mutual funds. They have grown less willing to invest in funds with higher front-end-load fees. However, funds with higher operating expense ratios have not lost market share. Using mutual fund flows from 1970 to 1999 and actual mutual fund purchase and sale decision by investors at a large discount broker from 1991 to 1996, our empirical analysis documents consistently negative relations between fund flows and front-end-load fees or commissions but no relation (or a perverse, positive relation) between fund flows and operating expenses. When we split operating expenses into marketing expenses (12B-1 fees) and other expenses, we find that investors are more likely to buy funds with higher marketing expenses but less likely to buy those with higher other operating expenses. We argue that, all else equal, investors prefer to pay lower fees to mutual fund companies, but they have grown sensitive to front-end-load fees and commissions more quickly than to operating expenses. This is because front-end-load fees and commissions are more obvious and salient. Front-end-load fees are particularly salient for investors who have previously paid them. We find that experienced mutual fund investors are less likely to pay front-end loads than first-time buyers, but experienced mutual fund investors do not invest in mutual funds with lower operating expenses.

We report evidence that mutual fund marketing does work. On average, any negative effect of expense fees on fund flows is more than offset when that money is spent on marketing; nonmarketing expenses, however, reduce fund flows. Although front-end load fees are also spent on marketing, the positive effect of marketing on flows does not appear to be sufficient to offset investors' growing awareness of and aversion to loads.

17. *Mutual Funds* named Vanguard #1 in the Best Service category and as the favorite fund family overall, based on a 1999 survey of 2,000 subscribers. A November 2000 *SmartMoney* survey of 600 randomly selected readers named Vanguard as the Best Fund Family. *Worth* designated Vanguard the winner in both the Best Fund Family and Best Discount Broker categories for service and performance, based on a 1999 survey of 4,000 readers.

From 1962 to 1999, the average operating expense charged by mutual funds has steadily increased (see fig. 2), while the proportion of funds charging front-end-load fees and the level of those load fees have declined (see fig. 1). While, no doubt, there are many plausible explanations for this observed pattern, one possibility is that mutual fund managers have figured out that investors are sensitive to load fees but less so to operating expenses.

Investors would benefit from a greater understanding and awareness of mutual fund expenses. While educating investors is a complex and multifaceted task, our results support the GAO's recommendation that one step in that process could be for mutual funds to disclose to investors the actual dollar amount of fees paid. Expenses that remain out of sight are likely to remain out of mind.

We will postpone this presentation until next week.

Hello All,

On Thursday, October 17th, we will welcome Matthew Kozora, an economist at the Securities and Exchange Commission, to present his work on "The Effect of Regulatory Regimes on the Provision of Retail Investment Advice." The paper is available at SSRN ([http://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=2323519](http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2323519)), and I have attached a copy below. Matt's work has close ties to our conflicted advice project, and may have implications for the regulatory impact analysis. I hope others (not involved in the conflicted advice project) will be interested in this work as an example of how to examine the effects of rulemaking.

I do not anticipate having slides for the presentation; Matt will present from the paper.

# The Effect of Regulatory Regimes on the Provision of Retail Investment Advice<sup>\*,\*\*</sup>

Matthew L. Kozora

*Working Paper*

## Abstract

Broker-dealers and investment advisers are two separate types of financial intermediaries subject to different regulatory regimes that can provide personalized investment advice about securities to investors. In this paper, I investigate whether differences between the broker-dealer regulatory regime and the investment adviser regulatory regime may be significant to retail investment advice by examining the principal transactions of investment grade municipal bonds. The results in this paper indicate that the advice retail investors receive may be dependent on the legal framework governing its provision. In particular, I find evidence of a potential relationship between the standards under which broker-dealers and investment advisers provide advice and the sale of investment grade municipal bonds to retail investors.

*Keywords: Retail Investors, Broker-Dealers, Investment Advisers, Fiduciary Standard of Conduct, Municipal Bonds*

## I. Introduction

Investors can receive personalized investment advice about securities (or “personalized investment advice”) from two regulated types of financial intermediaries, broker-dealers and investment advisers, that may provide similar services but are subject to two different and

separate regulatory regimes. At the federal level, firms registered as broker-dealers are subject to the Securities Exchange Act of 1934 (or “Exchange Act”) and the rules thereunder, and the rules of self-regulatory organizations (or “SROs”), whereas firms registered as investment advisers are subject to the Investment Advisers Act of 1940 (or “Advisers Act”) and the rules thereunder. A firm registered as both a broker-dealer and an investment adviser (or “dual registrant firm”) may provide both brokerage and advisory services, and depending on whether the account is a brokerage account or an advisory account, be subject to the rules of either regulatory regime.<sup>1</sup>

Little to no research currently exists indicating whether differences between the broker-dealer and the investment adviser regulatory regimes can be significant to the advice retail investors receive in non-discretionary accounts.<sup>2</sup> In this paper, I investigate the effect of regulatory regimes by examining the principal transactions of investment grade municipal bonds.<sup>3</sup> I find evidence that suggests the regulatory regime, in particular the standards under which advice is given, may be significant to the advice retail investors receive.

I use investment grade municipal bonds in this study for two primary reasons. First, retail investors are major participants in the municipal bond market, individually investing in close to one-half of all municipal bonds outstanding.<sup>4</sup> The illiquidity and opacity of the municipal securities market (SEC; 2012a) also increases the importance of a financial agent

---

<sup>1</sup>A recent study by U.S. Securities and Exchange Commission (SEC) staff on investment advisers and broker-dealers as pursuant to Section 913 of the Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010 (or the “913 Study”) provides an in-depth review of the two regulatory regimes.

<sup>2</sup>The focus of this paper is the provision of personalized investment advice in non-discretionary accounts. A non-discretionary account does not provide a financial agent authority to transact securities without the consent of the account holder, whereas a discretionary account grants such authority. Recent estimates place the number of non-discretionary advisory accounts managed by federally registered investment advisers at 5 million, and the number of brokerage accounts at federally registered broker-dealers at 110 million. Both estimates include both institutional and retail accounts. Investment adviser information can be found at [www.sec.gov/foia/iareports/inva-archive.htm](http://www.sec.gov/foia/iareports/inva-archive.htm). The broker-dealer estimate includes both non-discretionary and discretionary accounts, and can be found in SEC (2011). I will refer to advisory clients with non-discretionary accounts as “advisory clients” or “clients,” brokerage customers with non-discretionary accounts as “brokerage customers” or “customers,” and brokerage customers and advisory clients generally as “investors.”

<sup>3</sup>A principal transaction is a transaction where the broker-dealer or investment adviser buys or sells securities for its own account.

<sup>4</sup>The estimate is as of the third quarter 2012, and can be found in the *Flow of Funds Accounts of the United States* statistical release, published by the Federal Reserve.

to provide advice to their customer or client.

Second, I use investment grade municipal bonds to incorporate a regulatory event into the empirical methodology. The regulatory event is the October 2007 adoption of a temporary SEC rule (or “temporary rule”). The temporary rule, among other things, established an alternative set of principal transaction disclosure and consent requirements under the Advisers Act for investment advisers also registered as broker-dealers. Prior to the temporary rule adoption, dual registrant firms typically did not engage in principal transactions with advisory clients, engaging in principal transactions with brokerage customers only.<sup>5</sup> Dual registrant firms adhering to the temporary rule (or “BA firms”) began engaging in principal transactions with both brokerage customers and advisory clients. Other firms, including all firms registered solely as broker-dealers and those dual registrant firms not adhering to the temporary rule (or “B firms”), continued to engage in principal transactions with brokerage customers only.<sup>6</sup> The temporary rule, still in effect at the time of this writing, does not permit a firm to rely on the rule for securities that it or an affiliated entity underwrites or issues except for non-convertible investment grade debt. I therefore use municipal bonds of investment grade only to be certain that the temporary rule can apply to all principal transactions in the empirical sample.<sup>7</sup>

The time period of the study is from January 2006 to December 2008. Broadly, I investigate whether regulatory regimes may be significant to the provision of personalized investment advice by comparing the change to the principal transactions of BA firms following the temporary rule adoption with the change to the principal transactions of B firms. If adherence to the temporary rule and the recommendation and transaction of investment

---

<sup>5</sup>In the initial temporary rule release, the SEC describes discussions with representatives of dual registrant firms regarding the difficulties of complying with the disclosure requirements under Section 206(3) of the Advisers Act (SEC; 2007). Firms explained that they typically did not engage in principal transactions with advisory clients as a result of the operationally restrictive disclosure requirements. The temporary rule has since been extended to December 31, 2014. See Section II.a for further explanation.

<sup>6</sup>I utilize municipal bond transaction data from the Municipal Securities Rulemaking Board (MSRB) Real-time Transaction Reporting System (RTRS). MSRB requires all broker-dealers and municipal securities dealers to report the transactions of municipal securities. Consequently, no firms in the sample are registered solely as investment advisers.

<sup>7</sup>See Section II.a for a further discussion of the temporary rule.

grade municipal bonds subject to the investment adviser regulatory regime is significant, then I may observe a difference in the change in principal transactions between BA firms and B firms as BA firms apply the temporary rule and the investment adviser regulatory regime to activities that would have otherwise been subject to only the broker-dealer regulatory regime.

As part of the empirical methodology, I specifically investigate whether the standard of conduct as required by federal and state law may be significant to the provision of personalized advice to retail investors.<sup>8</sup> At the federal level, an investment adviser is a fiduciary who is to serve in the best interests of its clients, including an obligation not to subordinate the clients' interests for their own and to disclose or eliminate all material conflicts of interest, whereas broker-dealers are required to deal fairly with their customers and in most instances are not considered a fiduciary. At the state level, broker-dealers may be subject to a fiduciary standard of conduct (SEC; 2011).<sup>9</sup>

I refine the broad comparison between BA firms and B firms to the state level, and compare the difference in the change in principal transactions between the two firm classifications between states where broker-dealers may be subject to additional standards of conduct that relate to a fiduciary standard of conduct (i.e., "fiduciary states") and states where broker-dealers are generally not subject to a fiduciary standard of conduct (i.e., "non-fiduciary states"). I assume, similar to the equity "home bias" (Coval and Moskowitz; 1999), that retail investors purchase the bonds of local or within-state municipalities.<sup>10</sup> By assumption, additional state standards of conduct would apply to the principal transactions of the municipal securities relating to the state.

Adherence to the temporary rule by BA firms in non-fiduciary states brought about the

---

<sup>8</sup>Other differences between the two regulatory regimes include disclosure requirements, supervisory and control procedures, continuing education requirements, and restrictions on advertising and other communications. The investment adviser regulatory regime is also largely principles-based and not predominately rules-based like the broker-dealer regulatory regime.

<sup>9</sup>See Section II.b for a further discussion of standards of conduct.

<sup>10</sup>Exemption from state and local taxes may also induce retail investors to purchase bonds of local or within-state municipalities (SEC; 2012a).

introduction of a fiduciary standard of conduct to the portion of investment grade municipal bond recommendations and transactions with advisory clients that would have otherwise been with brokerage customers, whereas adherence to the temporary rule by BA firms in fiduciary states did not result in a similar introduction of a fiduciary standard of conduct. Regardless of the presence of state fiduciary laws, the standard of conduct governing the recommendation and transaction of investment grade municipal bonds by B firms did not change following the temporary rule adoption as these firms continued to engage in principal transactions with brokerage customers only. Taken together, changes to the principal transactions of BA firms relative to B firms in fiduciary states may relate to the temporary rule and the investment adviser regulatory regime, but not a fiduciary standard of conduct, and changes to the principal transactions of BA firms relative to B firms in non-fiduciary states may relate to the temporary rule and the investment adviser regulatory regime including a fiduciary standard of conduct. An additional difference between BA firms and B firms in non-fiduciary states relative to fiduciary states, therefore, may relate to a fiduciary standard of conduct.

In the first set of tests, I investigate the effect of regulatory regimes on security recommendations by examining the sale of investment grade municipal bonds to retail investors. I do not find evidence indicating a difference in the change in sales to retail investors between BA firms and B firms following the temporary rule adoption in fiduciary states, but I do find evidence of additional sales to retail investors by BA firms relative to B firms in non-fiduciary states. Thus, I find evidence suggesting that a fiduciary standard of conduct may relate to the recommendation and sale of investment grade municipal bonds to retail investors, but no evidence that application of the temporary rule or other aspects of the investment adviser regulatory regime were also significant in explaining retail sales. In additional tests, I find that the relative increase in sales to retail investors by BA firms in non-fiduciary states was most significant soon after the temporary rule adoption. This result suggests that the increase in sales by BA firms in non-fiduciary states may relate more to the temporary rule

adoption and less to other factors which may also had an effect including events relating to the recent financial crisis.

In the second set of tests, I investigate the effect of regulatory regimes on the markup/markdown on, or the “transaction cost” (Harris and Piowar; 2006) of, investment grade municipal bonds. The implementation of policies and procedures to adhere to the temporary rule may have led to an increase in the compliance costs of BA firms. The increase in compliance costs may have resulted in higher transaction costs for retail investors who may have less access to pricing information than institutional investors (SEC; 2012a).<sup>11</sup> Research by Green, Hollifield, and Schürhoff (2007a) find evidence of differences in the level of informed trading between retail investors and institutional investors; transactions of smaller size, relating to retail investors, often exhibit less advantageous prices and a greater range of prices than the transactions of larger size, relating to institutional investors. I continue to distinguish bonds by state classification to investigate whether the additional increase in sales to retail investors by BA firms relative to B firms in non-fiduciary states was contemporaneous with an additional change in retail transaction cost.

I find evidence of an increase in transaction cost by BA firms relative to B firms following the temporary rule adoption in fiduciary states, but that the increase in transaction cost was not specific to retail transactions but also present in institutional transactions. Thus, I do not find evidence indicating that adherence to the temporary rule led specifically to additional retail investor transaction costs but instead find evidence of a more systematic change to the cost of all BA firm transactions. I also find evidence indicating an additional decrease in the cost of retail transactions by BA firms relative to B firms following the temporary rule adoption in non-fiduciary states. The time periods in which I find the additional decrease in transaction cost, however, only partially aligns with the time periods in which I find the additional increase in retail sales. Taken together, I do not find sufficient evidence in these

---

<sup>11</sup>See Section II.a for a further discussion of the requirements of the temporary rule. The markup/markdown bond traders set on firm inventory, especially for transactions that are more arm’s length, presumably would not be dependent on the account type of the investor and the regulatory regime under which the registered representative provides recommendations.

tests to conclude that changes to the regulatory regime stemming from the temporary rule adoption had an effect, either directly or indirectly, on the cost of retail transactions.

The results in this paper only provide suggestive evidence of the effects of regulatory regimes as a result of conducting tests at the firm level and not at the account level. Tests at the account level would require information describing the type of investor account, whether the transaction was solicited or unsolicited, and investor characteristics.<sup>12</sup> Other factors may be important in explaining the test results. I attempt to control for these other factors by comparing principal transactions between time periods, firms, and states, and controlling for differences between bonds, firms, and states with additional explanatory variables.

This is the first paper to empirically investigate the effect of regulatory regimes on the advice retail investors receive. The appropriate standard of conduct for broker-dealers and investment advisers is the subject of an ongoing debate among federal agencies, industry representatives, and investor advocacy groups. Some believe that a uniform fiduciary standard at the federal level applied across broker-dealers and investment advisers would provide additional retail investor protections, whereas others believe that a fiduciary standard of conduct applied to the broker-dealer regulatory regime would increase firm costs with little benefit and would ultimately result in reduced investor access to advice.<sup>13</sup> Examples of firm costs include ongoing costs relating to “back-office” functions, other compliance costs, and litigation costs.

Past research relating to the provision of financial advice typically investigates its net benefit or quality, and investigates only one type of financial agent or makes no distinction. Recent examples include Chalmers and Reuter (2011) who investigate the performance of

---

<sup>12</sup>The SEC recently requested data and other information relating to the benefits and costs of the standards of conduct and other obligations of broker-dealers and investment advisers (SEC; 2013). Examples of requested data and information include the types of services available to retail investors, the types of securities financial agents offer or recommend, and the costs to financial agents of providing personalized investment advice about securities.

<sup>13</sup>Comments to the 913 Study, including one by Oliver Wyman and the Securities Industry and Financial Markets Association, dated October 27, 2010, and one by State Farm VP Management Corporation, dated August 27, 2010, describe the potential costs of broker-dealers shifting to a fiduciary standard of conduct. All comment letters to the 913 Study and to a subsequent request for information and other data (SEC; 2013) can be found at <http://www.sec.gov/comments/4-606/4-606.shtml>.

brokerage customer retirement portfolios; and Mullainathan, Nöth, and Schoar (2011) who investigate the quality of investment advice provided by financial agents in an audit study.<sup>14</sup> These examples, as well as other research utilizing international data, indicate that retail investors do not always receive beneficial investment advice.<sup>15</sup> Other research finds conflicts of interest may partially determine the advice investors receive. For example, Bergstresser, Chalmers, and Tufano (2009) find that funds sold through an intermediary underperform funds sold directly to investors, and that the sale of underperforming funds may stem from conflicts of interest as a result of intermediary sales incentives.<sup>16</sup> I find that the advice investors receive may be partially determined by the regulatory regime governing its provision, and that investment advice should be evaluated in this respect.

Although the focus of this paper is on the provision of personalized investment advice, it also contributes to the municipal bond literature investigating municipal securities markets including Harris and Piwowar (2006); Green, Hollifield, and Schürhoff (2007a); Green, Hollifield, and Schürhoff (2007b); Green, Li, and Schürhoff (2010); Li and Schürhoff (2012); and Schultz (2012). I find evidence that the regulatory regime governing the provision of personalized investment advice may be an important determinant in the transaction of these securities, especially with respect to retail investors.

I organize the rest of the paper as follows: Section II provides additional regulatory background information, Section III describes the data, Section IV describes the tests of sales to retail investors, Section V describes the tests of transaction cost, and Section VI concludes.

---

<sup>14</sup>In relation to this paper, it is unclear whether Mullainathan et al. (2011) conduct audits of broker-dealers, investment advisers, or both. For instance, their use of the term “investment advisers” relates to “retail advisers whom the average citizen can access via their bank, independent brokerages, or investment advisory firms.” Thus, their definition of investment adviser seemingly incorporates both broker-dealers and investment advisers.

<sup>15</sup>Examples of research utilizing international data to investigate the quality of investment advice include Bhattacharya, Hackethal, Kaesler, Loos, and Meyer (2012); Fecht, Hackethal, and Karabulut (2010); Bluethgen, Meyer, and Hackethal (2008); Bluethgen, Gintschel, Hackethal, and Müller (2008); Karabulut (2011); Kramer (2009); and Kramer and Lensink (2009).

<sup>16</sup>Other work examining the distribution of mutual funds include Del Guercio and Reuter (2011); Del Guercio, Reuter, and Tkac (2010); and Christoffersen, Evans, and Musto (2013).

## II. Regulatory Background

This paper investigates the effect of regulatory regimes on the provision of personalized investment advice to retail investors. The null hypothesis is that the temporary rule and differences between the regulatory regimes do not matter to the principal transactions of investment grade municipal bonds relating to retail investors. The alternative hypothesis is that the temporary rule and differences between the regulatory regimes do matter to the principal transactions of investment grade municipal bonds relating to retail investors. Below, I provide additional background on the temporary rule, the investment adviser regulatory regime, and fiduciary standards of conduct. Figure 1 provides a diagram of the changes to the regulatory regime governing the principal transactions of investment grade municipal bonds by firm and state classification during the sample period.

### II.a *Changes to the Regulatory Regime Governing Principal Transactions*

The temporary rule establishes an alternative means for dual registrant firms to meet the requirements under Section 206(3) of the Advisers Act when engaging in principal transactions with non-discretionary advisory clients (SEC; 2007). The temporary rule, adopted in October 2007, was in direct response to a March 2007 court decision (*Financial Planning Association v. U.S. Securities and Exchange Commission*) overturning an SEC rule exempting broker-dealers from the definition of “investment adviser” when charging non-transaction based compensation (or “fee-based” brokerage accounts).<sup>17</sup>

Section 206(3) of the Advisers Act requires an investment adviser to provide written conflict-of-interest disclosure describing its role as principal when transacting securities from its own account and obtain client consent prior to transaction completion. The temporary rule provides a dual registrant firm the option of providing transaction-by-transaction disclosures verbally instead of in writing when engaging in principal transactions with non-

---

<sup>17</sup>Non-transaction based fees include fees based on the amount of assets under management. A consequence of the court decision was the requirement that dual registrant firms and broker-dealers treat fee-based brokerage accounts as advisory accounts, and that the firms as a result became subject to the restrictions of the Advisers Act when engaging in principal transactions. The temporary rule was adopted so that dually registered advisers could continue to engage in principal transactions with the customers of these accounts.

discretionary advisory clients as long as the firm satisfies additional requirements. Additional requirements of the temporary rule include the provision of a written prospective disclosure to clients describing the conflicts arising from principal transactions, acquisition of written revocable client consent prospectively authorizing such transactions, the provision of transaction-by-transaction confirmations, and the provision of annual reports itemizing the clients' principal transactions thereafter. The temporary rule does not relieve the obligations of the investment adviser regulatory regime including its fiduciary standard of conduct. Moreover, dual registrant firms engaging in principal transactions with advisory clients must also still adhere to the broker-dealer sales practice and best-execution obligations set by the SEC and SROs (SEC; 2007).

There are two primary changes to the regulatory regime governing the recommendation and transaction of investment grade municipal bonds stemming from adherence to the temporary rule which may have led to a change in sales to retail investors and retail transaction cost. The first primary change is the rules and requirements of the temporary rule itself. A dual registrant firm cannot rely on the rule for securities it or an affiliated entity underwrites or issues except for investment grade non-convertible debt. This restriction may have possibly resulted in a shift in sales from other securities to investment grade municipal bonds. Adherence to the temporary rule may have also led to an increase in compliance costs which may have been passed on to investors in the form of higher transaction costs. Compliance costs include the provision of written prospective disclosures, acquisition of written revocable client consent, and the implementation of systems to monitor adherence to the rule.

The second primary change is the application of the rules and requirements of the investment adviser regulatory regime, not including the rules and requirements of the temporary rule, to the recommendation and transaction of investment grade municipal bonds. The provision of personalized investment advice subject to the investment adviser regulatory regime, including a fiduciary standard of conduct, may have led to a change in security

recommendations retail investors receive and the cost of providing advice.<sup>18</sup>

Both primary changes may in some form have contributed to the results found below.<sup>19</sup> The results suggest that the introduction of a fiduciary standard of conduct to the recommendation and transaction of investment grade municipal bonds by BA firms in non-fiduciary states may have led to greater sales to retail investors.

## II.b *Standards of Conduct*

At the federal level, investment advisers are fiduciaries to their clients, whereas broker-dealers generally are not fiduciaries to their customers.<sup>20</sup> Both regulatory regimes provide protections to retail investors from abusive practices. Such protections include the obligation to seek best execution on customer or client orders, and the provision of investment advice which is suitable and in the best interests of their customers or clients. As part of a fiduciary duty, investment advisers also have an obligation to place the clients' interests in front of their own and to disclose or eliminate all material conflicts of interest.

In some states, broker-dealers are subject to a fiduciary standard of conduct (SEC; 2011). I assume that in practice standards of conduct, either directly or indirectly, are constraints to

---

<sup>18</sup>See footnote 13 and related text.

<sup>19</sup>Two other secondary changes may have also led to a change in security recommendations and transaction cost. The first of these secondary changes is the possible change in the number and the characteristics of investors with access to investment grade municipal bonds. As a result of the temporary rule, investment advisers at BA firms have greater ability to recommend certain securities from firm inventory to their advisory clients. If some advisory clients did not have access to these securities such as through additional brokerage accounts prior to the temporary rule adoption, then the adherence to the temporary rule may have changed the population of investors with access to these securities.

The second of these secondary changes is the change in the form of financial agent compensation for those customers transferring assets from fee-based brokerage accounts to commission-based brokerage accounts. Financial agents compensated with commissions may be more inclined to recommend securities not intended to be invested in long-term to collect transaction based fees. On the other hand, financial agents compensated with fees based on the amount of assets under management may be more inclined to recommend securities intended to be invested in long-term to avoid transaction costs.

Both the possible change in the population of investors with access to securities from firm inventory and the form of financial agent compensation would have effects that are more ongoing and that are independent of state fiduciary laws. The results, especially with respect to sales to retail investors, instead indicate that changes to the principal transactions of investment grade municipal bonds is dependent on state classification. It is possible, however, that these secondary changes also had an influence on the test results.

<sup>20</sup>There are differing interpretations as to when broker-dealers have a fiduciary obligation to their customers. The ambiguity stems from a lack of litigated cases impeding the development of case law, variation in customer contracts, and inconsistencies between states (Laby; 2010).

the investment advice financial agents provide. Although firms may not implement control and compliance systems or procedures to address differences in state law, state law may still be important to the provision of personalized investment advice. For instance, in case of customer dispute, federal courts would look to state law to determine the fiduciary obligations of a broker-dealer (Laby; 2010), and arbitrators can apply state laws to determine awards in case of customer arbitration.<sup>21</sup>

### III. Data Description

I obtain information describing the business of dual registrant firms and broker-dealers from public SEC filings, municipal bond characteristics from the Mergent Municipal Bond Securities Database (Mergent dataset) and SDC Platinum, municipal bond transaction data from the MSRB RTRS dataset, and state information from various sources.

The time period of study is from January 2006 to December 2008. I use bonds with offering dates between January 2006 and December 2006, and between October 2007 and September 2008. I choose a short time period to accurately test the change in municipal bond transactions while avoiding to the fullest extent possible the impact of the global financial crisis of 2008. I do not include municipal bonds with offering dates within 60 trading days of the court decision, from January 2007 to March 2007, and between the court decision and the temporary rule adoption, from March 2007 to September 2007, due to the legal uncertainty of the time period. Similar to Green et al. (2007a), my sample includes only bond transactions occurring within 60 trading days of the bond offering date. The 60 trading day window allows me to incorporate the municipal bonds that are the most frequently traded and to limit the number of municipal bonds with trading periods that overlap either the court decision or the temporary rule adoption.

---

<sup>21</sup>Customers of broker-dealers and dual registrant firms, including the advisory clients at dual registrant firms, typically sign pre-dispute arbitration agreements with their financial agent. Training materials from the Financial Industry Regulatory Authority (FINRA), which operates the largest dispute resolution program in the securities industry, guides arbitrators to seek guidance in most cases from the parties involved to determine the applicable law or laws. See *The Neutral Corner*, Volume 3 (2010), published by FINRA, and *Basic Arbitrator Training*, also published by FINRA, for training materials.

### III.a *Broker-Dealer and Dual Registrant Firm Information*

The initial sample of broker-dealers (and dual registrant firms) includes all broker-dealers that engaged in a municipal bond transaction during the sample period and that is reported in the MSRB RTRS dataset. I require all firms to file annual SEC Form X-17A-5 audited reports with information encompassing the sample period to ensure that the sample of broker-dealers does not change from before the court decision to after the temporary rule adoption. Form X-17A-5 is a financial and operational report that must be filed by all broker-dealers registered with the SEC, and can be found on the SEC's EDGAR system. I obtain information describing the firm's investment adviser business, if any, from annual SEC Form ADV filings. Investment advisers and dual registrant firms file Form ADV with the SEC to provide general information including the types of clients, compensation arrangements, and advisory activities. Past Form ADV filings can be found on the SEC's Investment Adviser Public Disclosure website.

I classify a firm as a BA firm if it files Form ADV, reports actively engaging in business as a broker-dealer, reports a positive number of non-discretionary advisory accounts, and reports that it engages in principal transactions with advisory clients. BA firms are only potentially adhering to the temporary rule because firms filing Form ADV do not specifically acknowledge adherence to the rule. A B firm either does not file Form ADV, does not report actively engaging in business as a broker-dealer, does not report a positive number of non-discretionary clients, or does not report that it engages in principal transactions with advisory clients. B firms, therefore, could not be relying on the temporary rule. Because firms generally did not engage in principal transactions with non-discretionary advisory clients prior to the temporary rule adoption, I classify firms using information from the time period following the rule adoption only. To obtain a more direct comparison between firms either adhering to the temporary rule or not adhering to the rule, I exclude firms that are not solely classified as either a BA firm or a B firm as of December 2007 and December 2008. There are 95 BA firms and 1,475 B firms that meet all sample requirements.

### III.b *Municipal Bond Characteristics*

I obtain bond characteristic information from the Mergent dataset. The Mergent dataset provides security and issue information for 484,256 individual bonds with offering dates between July 2005 and December 2008. I extract bond information from the Mergent dataset including the type and frequency of coupon payments, put options, call options, sinking fund provisions, non-standard interest frequency or interest calculation, credit enhancements, tax status, the type of debt-paying assets, and the use of proceeds. I obtain bond ratings information from SDC Platinum.

I exclude 26,075 individual bonds from the initial sample with missing offering price information, missing or inaccurate total offering amount information, remarketed bonds, and bonds not relating to any of the 50 states or the District of Columbia.<sup>22</sup> To incorporate the Harris and Piwovar (2006) bond model in my analysis, I exclude 16,586 individual bonds with a derivative or warrant feature, and 8,346 individual bonds with non-standard coupon payments (adjustable, floating, flexible, variable, inverse, or index-linked coupons). I also exclude 80,986 individual bonds that are either designated as non-investment grade or with missing ratings information in SDC Platinum to ensure that the temporary rule can apply to all bonds in the sample. There are 352,309 bonds remaining in the sample. Bond issuances are spread evenly throughout the sample period. There are 109,168 investment grade municipal bonds meeting sample requirements with offering dates between January 2006 and December 2006, and there are 89,543 investment grade municipal bonds meeting sample requirements with offering dates between October 2007 and September 2008.

### III.c *State Information*

I obtain state law information from Finke and Langdon (2012) who classify states and the District of Columbia into one of three categories based on whether broker-dealers are subject to a fiduciary standard of conduct, a quasi-fiduciary standard of conduct, or no

---

<sup>22</sup>I search for inaccurate total offering amount information by examining individual bonds with total offering amount less than denomination amount. Often these securities are zero-coupon bonds selling at a discount. However, it can also be indicative of data error. I find only a few such examples.

fiduciary standard of conduct. They base their classification scheme on court decisions and state regulations. It is unclear the extent to which state level fiduciary or quasi-fiduciary standards of conduct relate to the fiduciary standard of conduct of the investment adviser regulatory regime. For instance, Finke and Langdon (2012) note that some quasi-fiduciary states “impose a standard higher than the suitability standard imposed by FINRA for non-discretionary accounts.”

From the classification of Finke and Langdon (2012), I define a fiduciary state as a state where broker-dealers are subject to a fiduciary or quasi-fiduciary standard of conduct, and a non-fiduciary state as a state where generally broker-dealers are not subject to a fiduciary standard of conduct. State classifications relate to the standards of conduct governing the provision of advice in non-discretionary accounts. The difference between states is whether broker-dealers are either subject to additional standards of conduct that seemingly relate to a fiduciary standard or are generally not subject to a fiduciary standard of conduct. Table 1 presents a listing of fiduciary states and non-fiduciary states by geographic region. There are 37 fiduciary states and 14 non-fiduciary states. A little more than a quarter of bond issues relate to non-fiduciary states.

I obtain state income information from the U.S. Census Bureau, gross state product statistics from the Bureau of Economic Statistics, and tax information from the Federation of Tax Administrators. I incorporate the information in the regressions below to control for state level economic differences.

#### III.d *Municipal Bond Transaction Data*

I obtain municipal bond transaction data from the MSRB RTRS dataset. The dataset contains information for all municipal bond transactions from July 2005 to March 2009. Each observation provides information regarding bond cusip, trade date, time of trade, settlement date, bond price, par value, and transaction commissions. The dataset also contains fields identifying the transacting broker or brokers, the type of transaction (between two dealers or a dealer and a customer, sale or purchase), and dealer capacity (principal or agent). The

dataset does not contain information describing the type of investor engaging in customer transactions (institutional or retail), the type of customer account (brokerage or advisory), and whether the transaction was solicited or unsolicited. There are 5,382,087 observations relating to the principal transactions of sample investment grade municipal bonds in the final sample. In Appendix A.1, I describe measures to clean the dataset for missing or inaccurate trade dates, inaccurate prices, managed account transactions, and other possible data errors.

Table 2 presents the amount of investment grade municipal bond customer principal transactions relating to firms in the final sample. The table includes four panels presenting the total number and value of all customer transactions (Panel A), the total number and value of all sales to customers (Panel B), the total number and value of all sales to customers less than or equal to \$50,000 (Panel C), and the total number and value of all sales to customers less than or equal to \$20,000 (Panel D). I use sales to customers less than or equal to \$50,000 and less than or equal to \$20,000 to proxy for sales to retail investors. In each panel the table also presents transaction information by firm classification. In no year did B firms engage in more customer transactions or sales to customers than BA firms. Considering the number of BA firms to B firms, the comparison in customer transactions and sales highlights the difference in trading activity between the two classifications of firms.

## IV. Tests of Municipal Bond Sales

### IV.a *Empirical Model*

In the first set of tests, I investigate the effect of regulatory regimes on security recommendations by examining the sale of investment grade municipal bonds to retail investors. I define a transaction as a “retail transaction” if the par amount is less than or equal to \$50,000. Alternatively, I define a transaction as a retail transaction if the par amount is less than or equal to \$20,000. Evidence by Green et al. (2007a) indicates that sales to customers of smaller par amount exhibit greater average markups and intraday price dispersion than sales to customers of larger par amount. The greater price dispersion among smaller trans-

actions is akin to a set of investors, such as retail investors, with varying access to pricing information.

I estimate regressions at the individual bond level, measuring the sale of investment grade municipal bonds to retail investors with *ParSale*, equal to the net par sold to retail investors, and *NumSale*, equal to the net number of sales to retail investors. I include two sets of explanatory variables in the regression. Similar to the difference-in-difference-in-differences empirical methodology, the first set of explanatory variables controls for the time period of the bond offering date (either before the court decision or after the temporary rule adoption), the classifications of firms engaging in customer sales (either BA or B), and the state classification relating to the bond (either non-fiduciary or fiduciary). The variables include

- $I^{TR}$  - an indicator variable equal to 1 if the offering date of the bond is after the temporary rule adoption, and 0 if the offering date of the bond is before the court decision
- $\overline{I^{BA}}$  - a continuous variable with a range between 0 and 1 equal to the average of  $I^{BA}$  (an indicator variable equal to 1 if a BA firm engages in the bond sale, and 0 if a B firm engages in the bond sale) for all firms engaging in at least one customer sale regardless of par amount<sup>23</sup>
- $I^{NF}$  - an indicator variable equal to 1 if the bond relates to a non-fiduciary state, and 0 if the bond relates to a fiduciary state
- interaction terms between  $I^{TR}$ ,  $\overline{I^{BA}}$ , and  $I^{NF}$  -  $I^{TR} \times \overline{I^{BA}}$ ,  $I^{TR} \times I^{NF}$ ,  $\overline{I^{BA}} \times I^{NF}$ , and  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$

---

<sup>23</sup>I weight the average with the total par amount of firm customer sales. I average  $I^{BA}$  using all firms engaging in at least one customer sale regardless of transaction size instead of firms engaging in at least one retail sale to measure the classifications of firms that could have engaged in a retail sale.  $\overline{I^{BA}}$  is undefined for bonds with no customer sales. These bonds are therefore not in the regression sample.

The second set of explanatory variables controls for differences between firms, bonds, and states that could also be important in explaining retail sales. The potential amount of bond sales to retail investors should relate to the trading activity of the firms engaging in customer sales. I control for firm trading activity with a quarterly measure of net firm customer sales ( $CSales$ ) averaged at the bond level similar to  $\overline{I^{BA}}$  ( $\overline{CSales}$ ). I also control for differences between bonds by including variables describing the total par offering amount ( $TotPar$ ), bond maturity ( $Maturity$ ), and other bond characteristics (see Appendix A.2).

Assuming that retail investors purchase the bonds of within-state municipalities, economic differences between states could also be important in explaining retail sales. I control for differences in income distributions with annual median income ( $StateMedInc$ ) and annual income standard error ( $StateIncSE$ ). I also control for differences in investor demand ( $StateDmnd$ ) equal to the natural log of the product of state GDP and the maximum of personal, corporate, and bank state tax rates (Harris and Piwovar; 2006). Lastly I include aggregate state level total par offering amount ( $StateTotPar$ ) to control for recent bond issuance activity.

I rescale  $ParSale$ ,  $\overline{CSales}$ ,  $TotPar$ ,  $StateMedInc$ ,  $StateIncSE$ , and  $StateTotPar$ , by dividing each variable by 10,000 and then taking the natural log of one plus the scaled value. I also rescale  $NumSale$  and  $Maturity$  by taking the natural log of one plus its value. I lag  $\overline{CSales}$ ,  $TotPar$ ,  $StateTotPar$ ,  $StateMedInc$ ,  $StateIncSE$ , and  $StateDmnd$  to the quarter or year prior to the bond offering date. In equation form, I estimate the following regression

$$\begin{aligned}
Y_i = & \beta_0 + \beta_1 I_i^{TR} + \beta_2 \overline{I_i^{BA}} + \beta_3 \left( I_i^{TR} \times \overline{I_i^{BA}} \right) \\
& + \beta_4 I_i^{NF} + \beta_5 \left( I_i^{TR} \times I_i^{NF} \right) + \beta_6 \left( \overline{I_i^{BA}} \times I_i^{NF} \right) \\
& + \beta_7 \left( I_i^{TR} \times \overline{I_i^{BA}} \times I_i^{NF} \right) + \boldsymbol{\beta} \mathbf{X}_i + \varepsilon_i
\end{aligned} \tag{1}$$

where  $Y$  represents either  $ParSale$  or  $NumSale$ ,  $\beta$  represents model parameters,  $\mathbf{X}$  represents

the set of additional control variables,  $\varepsilon$  represents model error, and  $i$  indexes bonds.<sup>24</sup> I estimate both regressions using a tobit model that specifies censored observations at 0. I exclude individual bond observations with net par sold or net number of sales less than 0. With these observations, I am likely either missing transactions as a result of excluding firms not meeting sample requirements or miscategorizing transactions as relating to either retail or institutional customers.<sup>25</sup> I calculate  $t$ -statistics with standard errors clustered at the 6-digit cusip level to account for correlations in the error term at the level of the municipality. There are 157,116 observations relating to individual bonds in the regressions describing net sales less than or equal to \$50,000, and there are 157,979 observations relating to individual bonds in the regressions describing net sales less than or equal to \$20,000.

Two of the explanatory variables are of particular interest. The first variable of interest,  $I^{TR} \times \overline{I^{BA}}$ , controls for the change in retail sales following the temporary rule adoption in fiduciary states (setting  $I^{NF}$  equal to 0) dependent on the classification of firms engaging in bond customer sales. A significant regression parameter estimate corresponding to this variable indicates that the retail sale of a bond following the temporary rule adoption is dependent on the classifications of firms engaging in customer sales, and suggests that the temporary rule or the investment adviser regulatory regime, but not a fiduciary standard of conduct, may influence security recommendations.

The second variable of interest,  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$ , controls for the additional change in retail sales following the temporary rule adoption in non-fiduciary states (setting  $I^{NF}$  equal to 1) dependent on the classification of firms engaging in customer sales. A significant regression parameter estimate corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  indicates that there is an additional effect following the temporary rule adoption in the relationship between retail sales and the classifications of firms engaging in customer sales in non-fiduciary states, and

---

<sup>24</sup>I also include state fixed effects in an alternative regression specification. I find little difference in the results.

<sup>25</sup>I exclude 3,444 observations with either negative net retail or institutional sales (see Section IV.c) when the retail transaction threshold is set at \$50,000, and I exclude 2,473 observations with either negative net retail or institutional sales when the retail transaction threshold is set at \$20,000.

suggests that a fiduciary standard of conduct may influence security recommendations.

#### IV.b *Results*

Table 3a presents model estimates for regression equation (1) when the retail transaction threshold is set at \$50,000, and Table 3b presents model estimates for regression equation (1) when the retail transaction threshold is set at \$20,000. I find that the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}}$  are insignificant in all regressions, whereas the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  are positive and significant at the 95% confidence level in all regressions. The sign and significance of the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  indicate an additional increase in retail sales by BA firms relative to B firms in non-fiduciary states following the temporary rule adoption, and suggests that a fiduciary standard of conduct may relate to the retail sale of investment grade municipal bonds. The insignificance of the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}}$  indicate that I do not find evidence in this empirical setting that the temporary rule or other aspects of the investment adviser regulatory regime may also explain retail sales following the rule adoption.

Among the other control variables, I find that average firm customer sales, bond total par offering amount, and bond maturity are positive and significant determinants of retail sales, whereas other bond characteristics including sinking fund provisions, odd interest payment frequency, and federal and state taxes are negative and significant. In general, the sign and significance of the bond characteristic variables reflects the inclination of financial agents to avoid recommending and selling municipal bonds to retail investors with disadvantageous or complex features. I also find that state median income and investor demand are also positive and significant determinants of retail sales.

I estimate the possible economic significance of a fiduciary standard of conduct by subtracting the change in the unconditional expected value of *ParSale* and *NumSale* for a bond sold entirely by BA firms in non-fiduciary states with (a) the same change for a bond sold entirely by B firms in non-fiduciary states, and with (b) the same change for a bond sold

entirely by BA firms in fiduciary states. I calculate the unconditional expected amount of retail sales for a bond sold either entirely by BA firms or by B firms to obtain the most direct comparison between firm and state classifications as possible. In equation form, I estimate

$$\underbrace{(E[Y_{1,1,1}] - E[Y_{0,1,1}])}_{\Delta \text{ BA/non-fiduciary}} - \underbrace{(E[Y_{1,0,1}] - E[Y_{0,0,1}])}_{\Delta \text{ B/non-fiduciary}} - \underbrace{(E[Y_{1,1,0}] - E[Y_{0,1,0}])}_{\Delta \text{ BA/fiduciary}}$$

where  $Y$  represents either *ParSale* or *NumSale*, the first subindex of  $Y$  represents the value of  $I^{TR}$ , the second subindex of  $Y$  represents the value of  $\overline{I^{BA}}$ , and the third subindex of  $Y$  represents the value of  $I^{NF}$ . The first comparison, retail sales relating to B firms in non-fiduciary states, accounts for the change in expected retail sales in non-fiduciary states, and the second comparison, retail sales relating to BA firms in fiduciary states, accounts for the change in expected retail sales by BA firms. Neither comparison accounts for the change in bond sales as a result of an introduction of a fiduciary standard of conduct, such as with BA firms in non-fiduciary states, to a portion of security recommendations that would otherwise have not been subject to such a standard. The full difference, therefore, measures the potential effect of a fiduciary standard of conduct to the recommendation and sale of investment grade municipal bonds. To obtain a relative measure, I benchmark the full difference to the unconditional expected value of the dependent variables for a bond sold entirely by BA firms in non-fiduciary states prior to the court decision ( $E[Y_{0,1,1}]$ ).

Table 4 presents the estimates of economic significance. When the retail transaction threshold is set at \$50,000, I find that a fiduciary standard of conduct may lead to an 8.3% increase in *ParSale* and a 9.2% increase in *NumSale* per bond, and when the retail transaction threshold is set at \$20,000, I find that a fiduciary standard of conduct may lead to a 16.4% increase in *ParSale* and a 16.0% increase in *NumSale* per bond. The influence of a fiduciary standard of conduct on security recommendations does not necessarily imply that the recommendations are necessarily “better,” but does imply that the recommendations are different. For example, there is a trade-off between having securities in brokerage accounts

where generally the financial agent has no continuing obligation after providing investment advice but also does not charge ongoing fees, and having securities in advisory accounts where more typically the financial agent has agreed to a continuing obligation after providing investment advice but charges fees based on assets under management.<sup>26</sup> The decision to have long term assets in advisory accounts instead of brokerage accounts may therefore prove to be more costly in the long run.

#### IV.c *Extensions*

The time period of the study overlaps events relating to the recent financial crisis which may also have had an effect on the recommendation and sale of investment grade municipal bonds. For instance, bonds with offering dates from July 2008 to September 2008 have 60 trading day windows that overlap the bankruptcy of Lehman Brothers in September 2008. To investigate whether other events may have also led to a change in retail sales following the temporary rule adoption, I partition the full regression sample into calendar quarters and reestimate regression equation (1). That is, I reestimate regression equation (1) using bonds with offering dates either in the fourth quarter of 2006 and in the fourth quarter of 2007 (the first quarter following the temporary rule adoption), in the first quarter of 2006 and in the first quarter of 2008, in the second quarter of 2006 and in the second quarter of 2008, or in the third quarter of 2006 and the third quarter of 2008 (the fourth quarter following the temporary rule adoption). I partition the regression sample by calendar quarter to control for the effect of seasonal trends. If the results in the first set of tests relate to the adoption of the temporary rule, then I should find similar evidence either soon after the temporary rule adoption or throughout the post-event time period.

Table 5a presents the abbreviated regression results when the retail transaction threshold is set at \$50,000, and Table 5b presents the abbreviated regression results when the retail

---

<sup>26</sup>Whether a broker-dealer or investment adviser has continuing obligations is dependent on the contractual arrangement with the customer. Over 95% of investment advisers charge fees based on the percentage of assets under management and less than 10% of investment advisers charge transaction based compensation (SEC; 2011).

transaction threshold is set at \$20,000. I find that the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  are positive and statistically significant in the regressions describing the retail sale of bonds with offering dates in the first quarter and in the second quarter following the temporary rule adoption, and are insignificant in the regressions describing the retail sale of bonds with offering dates in the third quarter and in the fourth quarter. These results indicate that if a fiduciary standard of conduct was significant in resulting in additional investment grade municipal bond retail sales, then it was most significant shortly after the rule adoption and before the potential influence of other events. I also only find strong evidence that  $I^{TR} \times \overline{I^{BA}}$  is statistically significant in the regressions describing retail sales of bonds with offering dates in the second quarter. Thus, I do not find evidence of a trend that could relate to the temporary rule or other aspects of the investment adviser regulatory regime.

As a comparison to retail sales, I reestimate regression equation (1) but instead model institutional sales. I define a customer transaction as an “institutional transaction” if the par amount is strictly greater than \$50,000. The additional increase in retail sales by BA firms relative to B firms in non-fiduciary states following the temporary rule adoption could be the result of a relative overall increase in the sale of these securities by BA firms and may not pertain specifically to retail investors. I reestimate regression equation (1) using the full regression sample and the regression sample partitioned by calendar quarter.

Table 6 presents the regression results when I use the full regression sample. I find that the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}}$  are positive and statistically significant in both regressions, and that only in the regression describing *ParSale* is the parameter estimate corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  statistically significant albeit negative. These results suggest that although there was an increase in institutional sales by BA firms relative to B firms following the temporary rule adoption, the change in institutional sales dependent on the classification of firms engaging in customer sales was more positive for bonds relating to fiduciary states than to non-fiduciary states. Although a relationship potentially exists

between retail and institutional sales, these results suggest that the relative increase in retail sales by BA firms in non-fiduciary states is not reflective of an overall trend relating to these firms and securities. Table 7 presents the abbreviated regression results when I separate bond observations by calendar quarter. Similar to the quarterly regressions describing retail sales, and further evidence of a potential relationship between retail and institutional sales, I find that parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}}$  and  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  are significant in the regressions describing the institutional sale of bonds with offering dates in the first quarter and in the second quarter following the temporary rule adoption, and insignificant in the regressions describing the institutional sale of bonds with offering dates in the third quarter and in the fourth quarter.

## V. Tests of Retail Transaction Cost

### V.a *Empirical Model*

In the second set of tests, I investigate the effect of regulatory regimes on the transaction cost of investment grade municipal bonds. I utilize the Harris and Piwowar (2006) methodology to measure transaction cost.<sup>27</sup> The model describes bond price as a function of bond value, transaction cost, and interdealer price concession. The authors model transaction cost as a three term function. From this cost function, I obtain estimates of transaction cost at the individual bond level for transactions of par value equal to \$20,000, \$50,000, \$100,000, and \$1,000,000. Cost estimates of transactions of par value equal to \$20,000 and \$50,000 relate more to the cost of retail transactions, and cost estimates of transactions of par value equal to \$100,000 and \$1,000,000 relate more to the cost of institutional transactions.

To investigate the effect of regulatory regimes on transaction cost, I regress estimates of transaction cost on variables controlling for firm classification, the time period of the bond offering, the state classification relating to the bond, and other potential determinants of transaction cost including bond characteristics and state level variables. The additional variables in the cost function are similar to the explanatory variables that I use to explain

---

<sup>27</sup>See Appendix A.3 for a description of the methodology.

customer sales in Section IV. However, I respecify  $\overline{I^{BA}}$  and  $\overline{CSales}$  to take into consideration the utilization of each customer transaction to estimate transaction cost. I now define the variable  $\overline{I^{BA}}$  as the non-weighted average of  $I^{BA}$  of all customer transactions, both purchases and sales, and  $\overline{CSales}$  as the non-weighted average of the aggregate par amount of all firm customer transactions ( $\overline{CTrans}$ ). I estimate the following regression

$$\begin{aligned} \widehat{C}_{S,i} = & \beta_0 + \beta_1 I_i^{TR} + \beta_2 \overline{I_i^{BA}} + \beta_3 \left( I_i^{TR} \times \overline{I_i^{BA}} \right) \\ & + \beta_4 I_i^{NF} + \beta_5 \left( I_i^{TR} \times I_i^{NF} \right) + \beta_6 \left( \overline{I_i^{BA}} \times I_i^{NF} \right) \\ & + \beta_7 \left( I_i^{TR} \times \overline{I_i^{BA}} \times I_i^{NF} \right) + \beta \mathbf{X}_i + \varepsilon_i \end{aligned} \quad (2)$$

where  $\widehat{C}$  represents cost estimates and  $S$  represents transaction size.<sup>28</sup> I incorporate the Bayesian shrinkage estimator of Harris and Piwovar (2006) to calculate the variance of cost estimates, and weight regression observations with the inverse of the variances. I calculate  $t$ -statistics with standard errors clustered at the 6-digit cusip level to account for correlations in the error term at the level of the municipality. There are 57,540 individual bonds that meet the requirements of the Harris and Piwovar (2006) model, and 57,500 observations relating to individual bonds that are in the regression sample.

Similar to the regressions in Section IV, the two variables of interest are  $I^{TR} \times \overline{I^{BA}}$  and  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$ . A significant regression parameter estimate corresponding to  $I^{TR} \times \overline{I^{BA}}$  indicates a change in transaction cost following the temporary rule adoption in fiduciary states dependent on the classification of firms engaging in bond customer transactions. Significance of this variable suggests, especially for estimates of retail transaction cost, that the costs relating to compliance of the temporary rule may have resulted in an increase in the cost of BA firm transactions. A significant regression parameter corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  indicates an additional change in transaction cost in non-fiduciary states following the temporary rule adoption dependent on the classification of firms engaging in

---

<sup>28</sup>I also include state fixed effects in an alternative regression specification. I find little difference in the results.

bond customer transactions. The results in the first set of tests indicate an additional increase in retail sales by BA firms relative to B firms in non-fiduciary states. It is possible that this additional increase in retail sales is also contemporaneous with a change in retail transaction cost.

## V.b *Results*

Similar to Harris and Piwovar (2006), I find that customer transaction cost decreases as transaction size increases. For example, average transaction cost weighted by the inverse of cost estimate variance ranges from 87 basis points for transactions of \$20,000, to 77 basis points for transactions of \$50,000, to 63 basis points for transactions of \$100,000, and to 21 basis points for transactions of \$1,000,000. These estimates are similar to Harris and Piwovar (2006) who find that average customer transaction cost ranges from 99 basis points for transactions of \$20,000, to 77 basis points for transactions of \$50,000, to 62 basis points for transactions of \$100,000, and to 24 basis points for transactions of \$1,000,000.

Table 8a presents model estimates for regression equation (2) describing the cost of transactions of par value equal to \$20,000 and \$50,000, and Table 8b presents model estimates for regression equation (2) describing the cost of transactions of par value equal to \$100,000 and \$1,000,000. I find that  $I^{TR} \times \overline{I^{BA}}$  is a positive and significant determinant of transaction cost in all four regressions, and that  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  is a negative and significant determinant in regressions describing the cost of transactions of par value equal to \$20,000, \$50,000, and \$100,000. The significance and similar magnitude of parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}}$  in all four regressions suggests that the additional change in transaction cost dependent on the classification of firms engaging in customer transactions may not relate to the temporary rule but instead to other factors that would have a more systematic effect on the cost of all transactions regardless of size. The sign and significance of the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  indicate an additional decrease in retail transaction cost for those bonds relating to non-fiduciary states and with a greater proportion of transactions by BA firms. Although this additional decrease is greater for transactions relat-

ing more to retail investors, the tests below indicate that it may not relate to the additional increase in retail sales found in Section IV.

Among the other control variables, bond characteristics that are positive and significant determinants of retail transaction cost include bond maturity, optional call schedules, odd interest payment frequency, and state median income. Credit enhancements are also positively and significantly related to retail transaction cost, but more so prior to the temporary rule adoption than after; although the credit enhancement indicator variable is positive and statistically significant, the interaction term between the credit enhancement indicator variable and  $I^{TR}$  is negative and statistically significant. Retail transaction cost is also lower for bonds with total par offering amount. The sign and significance of many of the control variables are similar to the findings of Harris and Piwowar (2006).

### *V.c Extension*

To investigate whether other events could relate to the changes in transaction cost following the temporary rule adoption, I again partition the full regression sample into calendar quarters and reestimate regression equation (2). In each one of the regressions, the variables of interest are again  $I^{TR} \times \overline{I^{BA}}$  and  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$ .

Table 9a presents the abbreviated regression results describing the cost of transactions of par value equal to \$20,000 and \$50,000, and Table 9b presents the abbreviated regression results describing the cost of transactions of par value equal to \$100,000 and \$1,000,000. I find that  $I^{TR} \times \overline{I^{BA}}$  is positive in all regressions, and significant in at least one regression relating to each transaction size and quarter. On the other hand, I find that  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  is negative and statistically significant in the regressions describing the transaction cost of bonds with offering dates in the second quarter and in the third quarter following the temporary rule adoption. This result indicates that the time periods in which I find an additional decrease in retail transaction cost by BA firms relative to B firms in non-fiduciary states only partially overlaps the time periods in which I find an additional increase in retail sales. These two results, therefore, may not be related. Taken together, I do not find

enough evidence to conclude that changes to the regulatory regime governing the principal transactions of investment grade municipal bonds relate to changes in transaction cost that is specific to retail investors.

## VI. Conclusion

This paper is a first step in determining the importance of regulatory regimes to the provision of personalized investment advice about securities to retail investors. Broker-dealers and investment advisers may provide many of the same services yet are subject to two different legal frameworks. The results in this paper indicate that differences between the two regulatory regimes may be important to the advice retail investors receive.

This paper investigates just one aspect of the many services broker-dealers and investment advisers may provide. Although I utilize transaction level data, regulatory events, and additional information like state laws, the lack of account level information limits the efficacy of the empirical methodology. Both regulators and researchers would greatly benefit from information describing investor demographics, account characteristics, the types of security investments, and security returns. Such information can not only provide a more meaningful description of a market characterized by information asymmetries, but also an industry that is vital to the financial well-being of many retail investors.

# Appendix

## A.1 *MSRB RTRS Dataset*

There are 35,169,982 transaction observations in the MSRB dataset from July 2005 to December 2008.<sup>29</sup> The dataset reduces to 11,065,403 observations after I exclude bonds with missing issuance or bond information on Mergent, and bonds not meeting sample requirements (see Section II.b), and further reduces to 6,046,632 observations after I exclude transactions with missing trade date, time of trade, transaction price, and par amount information; inaccurate trade date information; and transactions with trade dates not within 60 trading days of the bond offering date.

I also exclude managed account transactions, or where an intermediary acts on the behalf of multiple customers and allocates securities across accounts. These transactions may appear in the dataset as a contemporaneous purchase and then sale to multiple customers at the same time and price with equal par amounts. There are 5,993,465 observations after combining multiple transactions with these similarities to one.

I identify observations with inaccurate transaction prices by comparing the price of an observation to the offering price of the bond and the prices of transactions that immediately precede and follow the observation. For each comparison price (relating to the offering price, the transaction price immediately preceding the observation, and the transaction price immediately following the observation), I calculate a measure equal to the absolute value of the observation price minus the comparison price, all divided by the observation price. I then separately rank each one the three sets of comparison measures. I classify a price as inaccurate with respect to one of the three comparison prices if it ranks in the top 0.05%. I choose 0.05% by examining outliers in the remaining sample when the threshold ranges from 0.01% to 0.1%.

---

<sup>29</sup>After August 2007, the original dataset separates each interdealer transaction into two observations. However, the original dataset also contains a field assigning each interdealer transaction an identification code. I use the identification code to combine the duplicate interdealer transactions. If I cannot match interdealer transactions on identification code, then I match on trade information. I assume the remaining interdealer transactions are non-duplicative.

I delete all individual observations from the sample where each one of the three comparison measures classify as inaccurate and the prices of the transactions immediately following and preceding the observation are also not inaccurate with respect to the next closest transaction. I also exclude all observations relating to a particular bond if an individual observation is inaccurate with respect to the offering price but I cannot delete it from the sample. This can occur when bond prices are inaccurate with respect to the offering price in consecutive transactions. I exclude 5,911 observations from the sample using this methodology, and I also exclude an additional 40,487 observations with bond price less than or equal to 0.01.

I also clean the dataset using par value traded information. I exclude observations with par value traded greater than total par offering amount. I also identify duplicate observations in the dataset by aggregating the par value traded to customers. I consider identical observations to be duplicate if the total par value sold to customer accounts is greater than the total par offering amount by the par value traded. I exclude 369 transactions that are duplicate and 2,209 observations with par traded greater than total par offering amount. Past researchers have taken additional steps to refine the MSRB transaction dataset. The additional refinements, however, impose additional assumptions on the dataset. There are 5,944,489 observations before excluding additional observations relating to agency transactions, and bonds that are not investment grade from the final sample.

## *A.2 Bond Characteristic Variables*

The following is a list of bond characteristic indicator variables that I use in the regressions as explanatory variables. I define each variable with information from the Mergent dataset.

- *AAA* - equal to 1 if the bond has an investment grade rating of AAA, 0 otherwise
- *OptCallSched* - equal to 1 if the bond has an optional call schedule, 0 otherwise
- *ExtraOrdCall* - equal to 1 if the bond issue is subject to an extraordinary call, 0 otherwise

- *PutOption* - equal to 1 if the bond has a put option, 0 otherwise
- *CredEnh* - equal to 1 if the bond has either additional credit or bond insurance, 0 otherwise
- *SinkFund* - equal to 1 if the bond has a sinking fund provision, 0 otherwise
- *OddIntFreq* - equal to 1 if the frequency of interest payments is not semi-annual, 0 otherwise
- *OddIntCalc* - equal to 1 if the interest calculation is not 30 days per month by 360 days per year, 0 otherwise
- *GenObl* - equal to 1 if the security is a general obligation bond, 0 otherwise
- *RevBond* - equal to 1 if the security is a revenue bond, 0 otherwise
- *GenPurp* - equal to 1 if the security is for general purpose or public improvement, 0 otherwise
- *Education* - equal to 1 if the use of proceeds relates to higher education, primary and secondary education, and other education; 0 otherwise
- *Utility* - equal to 1 if the use of proceeds relates to public utilities including power, gas telephone, water, and waste; 0 otherwise
- *Health* - equal to 1 if the use of proceeds relates to hospitals, nursing homes, and other healthcare; 0 otherwise
- *CertPart* - equal to 1 if the type of debt is a certificate of participation, 0 otherwise
- *FedTax* - equal to 1 if the maturity is taxable at the federal level, 0 otherwise
- *StateTax* - equal to 1 if the maturity is taxable by the state of issue, 0 otherwise

I also include an interaction term between *CredEnh* and  $I^{TR}$  ( $CredEnh \times I^{TR}$ ) to control for the potential change to the influence of credit enhancements on bond transactions as a result of the financial crisis.

### A.3 *Harris and Piwovar (2006) Methodology*

I follow Harris and Piwovar (2006) and model bond price  $P$  as a function of bond value  $V$ , investor transaction cost  $C$ , and interdealer price concession  $\delta$ . Transaction cost is dependent on whether the bond transaction is a dealer sale to a customer, a dealer purchase from a customer, or an interdealer transaction. To incorporate differences in transaction type, investor transaction cost is interacted with variable  $Q$ , equal to 1 if the transaction is a dealer sale to a customer, equal to -1 if the transaction is a dealer purchase from a customer, and equal to 0 if the transaction is an interdealer trade. Interdealer price concession  $\delta$  is interacted with an indicator variable  $I^D$ , equal to 1 if the trade is an interdealer trade, and equal to 0 otherwise. In equation form, the price for bond  $i$  at time  $t$  is

$$P_{it} = V_{it} + Q_{it}P_{it}C_{it} + I_{it}^D P_{it}\delta_{it}$$

After taking the natural log of both sides of the bond price equation, the price equation for bond  $i$  at time  $t$  is subtracted from the price equation for bond  $i$  at time  $s$ . Following the approximations made by Harris and Piwovar (2006), the equation for the difference in bond price from time  $s$  to time  $t$  is

$$r_{its}^P = r_{ts}^V + Q_{it}C_{it} - Q_{is}C_{is} + I_{it}^D\delta_{it} - I_{is}^D\delta_{is}$$

where  $r^P$  represents the difference in the natural log of bond price and  $r^V$  represents the difference in the natural log of bond value. I define time  $s$  using the most recent bond trade, either customer or interdealer, prior to the trade at time  $t$ . If more than one bond transaction occurs at time  $s$ , then I use the bond transaction with greatest par value to calculate returns for transactions that occur at time  $t$ . Large transactions, typically involving institutional investors, are likely to provide more information than small transactions, possibly involving

retail investors. If more than one transaction occurs at time  $t$ , then time  $s$  is equal to time  $t$ . In this instance, I use the transaction with the greatest par amount to calculate differences in the natural log of bond price.

Harris and Piwovar (2006) model the difference in the natural log of bond value between the two trades as

$$r_{its}^V = N_{ts}^{CalDay}(5\% - Coupon_i) + \beta_1^V AvgSL_{ts} + \beta_2^V DiffSL_{ts} + \gamma_{its}$$

where  $N_{ts}^{CalDay}$  represents the number of calendar days between time  $s$  and time  $t$ ,  $(5\% - Coupon)$  represents the difference between the bond's coupon interest rate and 5%,  $AvgSL$  represents the average in and  $DiffSL$  represents the difference between short-term and long-term index returns, and  $\gamma$  is model error. The difference between the bond's coupon rate and 5%, in units of one calendar day, measures the return a trader would expect between trade dates when interest rates are constant. The expression of all bond returns in this manner, including when calculating bond index returns, should not affect the results. The error term  $\gamma$  has mean zero and variance equal to  $N_{ts}^{TrdSes} \sigma_{TrdSes}^2$  where  $N_{ts}^{TrdSes}$  represents the number of trading sessions from time  $s$  to time  $t$ . I estimate index returns using a repeat sales regression methodology (Case and Shiller; 1987).<sup>30</sup>

Harris and Piwovar (2006) model transaction cost as a three or four term function. The primary cost function in their analysis is

$$C_i = c_0 + c_1 S_i^{-1} + c_2 \ln S_i + \kappa_i$$

where  $c_0$ ,  $c_1$ , and  $c_2$  represent model parameters;  $S$  represents transaction size; and  $\kappa$  represents model error. They motivate the equation as one part that controls for cost as a proportion of transaction size ( $c_0$ ), one part that controls for fixed costs per trade, ( $c_1 S^{-1}$ ), and one part that controls for cost as it varies with transaction size ( $c_2 \ln S$ ).

The bond price equation is modeled separately for each bond. The full bond price

---

<sup>30</sup>See Appendix A.4 for a full explanation of the repeat sales regression methodology.

equation is

$$r_{its}^P - N_{ts}^{CalDay}(5\% - Coupon_i) = \beta_1^V AvgSL_{ts} + \beta_2^V DiffSL_{ts} + Q_{it}C_{it} - Q_{is}C_{is} + \eta_{its} \quad (3)$$

where  $\eta$  represents model error. The error term  $\eta$  can be expressed as

$$\eta_{its} = \gamma_{its} + I_{it}^D \delta_{it} - I_{is}^D \delta_{is} + Q_{it} \kappa'_{it} - Q_{is} \kappa'_{is}$$

with zero mean and variance,  $\sigma_\eta^2$ , that can be expressed as

$$\sigma_\eta^2 = N^{TrdSes} \sigma_{TrdSes}^2 + D_{ts} \sigma_\delta^2 + (2 - D_{ts}) \sigma_\kappa^2$$

where  $D_{ts}$  is equal to the number of interdealer transactions between each of the two trades (0, 1 or 2),  $\sigma_\delta^2$  represents the variance of  $\delta$ , and  $\sigma_\kappa^2$  represents the variance of  $\kappa$ .

I follow Harris and Piwowar (2006) and use an iterated least squares methodology to estimate parameter estimates of equation (3) with weights equal to the inverse of  $\sigma_\eta^2$  estimates. Estimates of  $\sigma_\eta^2$  are obtained by pooling error terms from equation (3) and regressing the square of these error terms on  $N^{TrdSes}$ ,  $D_{ts}$ , and  $(2 - D_{ts})$ . The parameters multiplying  $N^{TrdSes}$ ,  $D_{ts}$ , and  $(2 - D_{ts})$  are constrained to be strictly greater than zero.

#### A.4 Repeat-Sale Regression

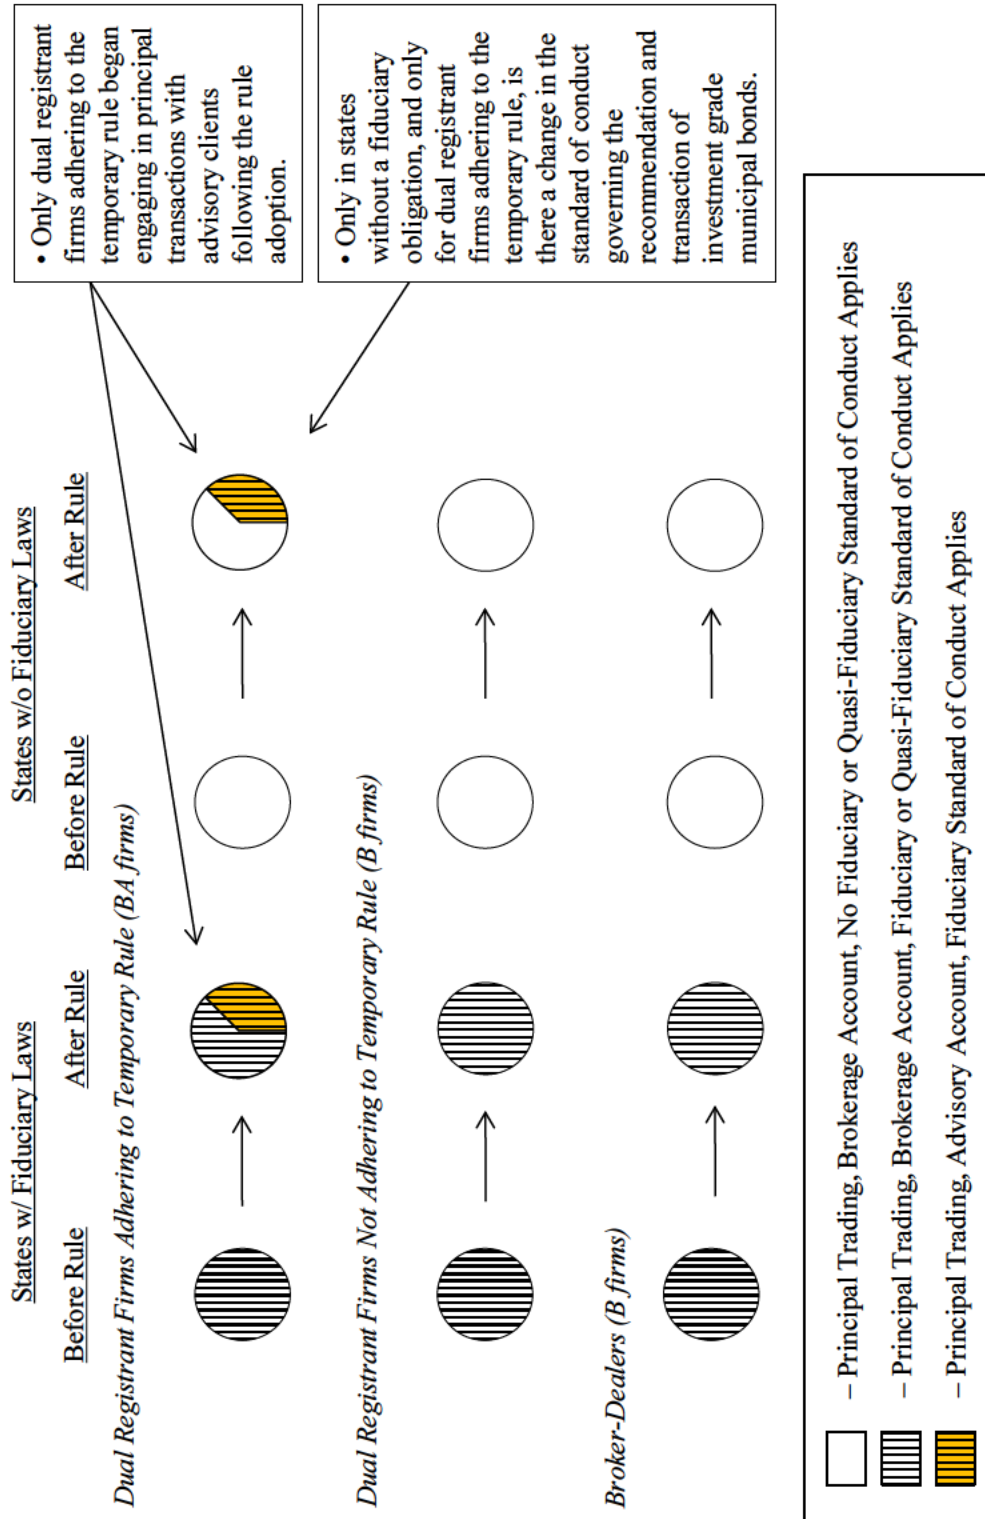

I calculate short-term and long-term bond daily index returns using the repeat-sale regression method of Case and Shiller (1987), regressing the returns of short-term bonds or long-term bonds on a set of indicator variables representing trade dates. I define bonds as short-term if less than 60 months remain until maturity, and bonds as long-term if at least 144 months remain until maturity. The indicator variables,  $I^{td}$ , are equal to 1 if the bond is held or sold on the trade date, 0 otherwise. The repeat-sale regression in equation form for all trades from the beginning of the sample period ( $\tau = 1$ ) to the end of the sample period ( $\tau = T$ ) is

$$r_{its} - N_{ts}^{CalDay}(5\% - Coupon_i) = \sum_{1 \leq \tau \leq T} \beta_\tau I_\tau^{td} + \zeta_{its} \quad (4)$$

where  $r_{its}$  represents the difference in the natural log of the price of bond  $i$  between time  $s$  and time  $t$ ,  $N_{ts}^{CalDay}$  represents the number of calendar days between time  $s$  and time  $t$ , and  $(5\%-Coupon)$  is the difference between the bond's coupon interest rate and 5% in units of one calendar day.

I obtain parameter estimates for both short-term and long-term bonds using a three-step procedure beginning with an initial estimate of equation (4). I then regress the initial squared estimates of  $\zeta$  on the total number of days between consecutive trades, the squared total number of days between trade dates, and an intercept. Lastly, I reestimate equation (4) using fitted values from the second stage as regression weights. I use interdealer transactions only in the repeat-sale regression to avoid noise from the bond prices of customer transactions. If more than one interdealer transaction occurs for the same bond on a given trade date, then I use the last interdealer transaction on that date.

**Figure 1: Changes to the Regulatory Regime Governing the Principal Transactions of Investment Grade Municipal Bonds by Firm and State Classification**

This figure describes the change in the regulatory regime governing principal transactions dependent on firm classification and the presence of state fiduciary laws. For simplicity, this figure does not account for changes to the proportion of advisory accounts held at dual registrant firms following the court decision and temporary rule adoption. See Section II for further discussion.

**Table 1: State Classification by Region**

| <b>Region</b> | <b>Non-Fiduciary States</b>                            | <b>N</b> | <b>Fiduciary States</b>                                                                                                                                       | <b>N</b> |
|---------------|--------------------------------------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|               | States                                                 |          | States                                                                                                                                                        |          |
| Northeast     | Massachusetts, New York                                | 2        | Connecticut, Maine, New Hampshire, New Jersey, Pennsylvania, Rhode Island, Vermont                                                                            | 7        |
| Midwest       | Minnesota, North Dakota, Wisconsin                     | 3        | Illinois, Indiana, Iowa, Kansas, Michigan, Missouri, Nebraska, Ohio, South Dakota                                                                             | 9        |
| Southeast     | Arkansas, Mississippi, North Carolina                  | 3        | Alabama, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Oklahoma, South Carolina, Tennessee, Texas, Virginia, West Virginia | 14       |
| West          | Arizona, Colorado, Hawaii, Montana, Oregon, Washington | 6        | Alaska, California, Idaho, New Mexico, Nevada, Utah, Wyoming                                                                                                  | 7        |
| Number        |                                                        | 14       |                                                                                                                                                               | 37       |

This table lists the states either classifying as a fiduciary state or a non-fiduciary state by region. A fiduciary state requires broker-dealers to operate in a fiduciary or quasi-fiduciary capacity, whereas a non-fiduciary state makes no such requirements. See Sections II.b and III.c for a further description.

**Table 2: Number and Par Value of Customer Transactions**

| Year | All                                         |        | BA      |        | B       |        | All     |        | BA      |        | B       |       |
|------|---------------------------------------------|--------|---------|--------|---------|--------|---------|--------|---------|--------|---------|-------|

This table presents the aggregate number and value of all investment grade municipal bond customer principal transactions. Panel A presents information describing all customer sales and purchases, Panel B presents information describing all sales to customers, Panel C presents information describing all sales to customers less than or equal to \$50,000, and Panel D presents information describing all sales to customers less than or equal to \$20,000. The table presents customer transactions for all firms, for dual registrant firms engaging in principal transactions with brokerage and advisory clients after the temporary rule adoption (BA firms), and for firms engaging in principal transactions with brokerage clients only after the temporary rule adoption (B firms). I obtain transaction information from the MSRB RTRS dataset.

This table reports the results from tobit regressions describing the net par amount sold (*ParSale*) and the net number of municipal bond sales (*NumSale*) to retail investors. The regression model is equation (1). Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm sales, bond characteristics, and state level factors. In these tests, I define retail sales as customer sales with par value less than or equal to \$50,000. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section IV for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

This table reports estimates of the potential economic significance of a fiduciary standard of conduct. Columns with “ $E[Y]$ ” headers report the unconditional expected value of the dependent variables stemming from the estimation of regression equation (1) given the time period of the retail sales,  $I^{TR}$ , the classification of firms engaging in customer sales,  $\overline{I^{BA}}$ , and the state classification relating to the bond,  $I^{NF}$ . All other variables are set to its sample mean. The variable  $Y$  represents either *ParSale* or *NumSale*. Columns with “ $\Delta_i$ ” headers report differences between time periods, and the third to last column reports the full difference between all firm and state classifications. I benchmark the full difference with the unconditional expected value of the dependent variables by BA firms in non-fiduciary states prior to temporary rule adoption. The last column relates the full difference to the benchmark. See Section IV for full explanation.

This table reports the abbreviated results from tobit regressions describing the net par amount sold (*ParSale*) and the net number of municipal bond sales (*NumSale*) to retail investors. The regression model is equation (1). I partition the full regression sample by calendar quarter. Q1 - Q4 refer to the first quarter to the fourth quarter following the temporary rule adoption. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm sales, bond characteristics, and state level factors. In these tests, I define retail sales as customer sales with par value less than or equal to \$50,000. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section IV for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

This table reports the abbreviated results from tobit regressions describing the net par amount sold (*ParSale*) and the net number of municipal bond sales (*NumSale*) to retail investors. The regression model is equation (1). I partition the full regression sample by calendar quarter. Q1 - Q4 refer to the first quarter to the fourth quarter following the temporary rule adoption. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm sales, bond characteristics, and state level factors. In these tests, I define retail sales as customer sales with par value less than or equal to \$20,000. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section IV for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

This table reports the abbreviated results from tobit regressions describing the net par amount sold (*ParSale*) and the net number of municipal bond sales (*NumSale*) to institutional investors. The regression model is equation (1). I partition the full regression sample by calendar quarter. Q1 - Q4 refer to the first quarter to the fourth quarter following the temporary rule adoption. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm sales, bond characteristics, and state level factors. In these tests, I define institutional sales as customer sales with par value strictly greater than \$50,000. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section IV for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

Table 8a: Regressions Describing Retail Transaction Cost

This table reports the results from weighted regressions describing the cost of transactions of par value equal to \$20,000 and \$50,000. The regression model is equation (2). I weight observations with the inverse with transaction cost estimate variance. I follow the Harris and Piwovar (2006) methodology. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm transactions, bond characteristics, and state level factors. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section V for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

This table reports the results from weighted regressions describing the cost of transactions of par value equal to \$100,000 and \$1,000,000. The regression model is equation (2). I weight observations with the inverse with transaction cost estimate variance. I follow the Harris and Piwowar (2006) methodology. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm transactions, bond characteristics, and state level factors. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section V for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

**Table 9a: Regressions Describing Transaction Cost by Calendar Quarter**

This table reports the results from weighted regressions describing the cost of transactions of par value equal to \$20,000 and \$50,000. The regression model is equation (2). I partition the full regression sample by calendar quarter. Q1 - Q4 refer to the first quarter to the fourth quarter following the temporary rule adoption. I weight observations with the inverse with transaction cost estimate variance. I follow the Harris and Pivovarov (2006) methodology. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm transactions, bond characteristics, and state level factors. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section V for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

---

We will postpone this presentation until next week.

Hello All,

On Thursday, October 17th, we will welcome Matthew Kozora, an economist at the Securities and Exchange Commission, to present his work on "The Effect of Regulatory Regimes on the Provision of Retail Investment Advice." The paper is available at SSRN ([http://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=2323519](http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2323519)), and I have attached a copy below. Matt's work has close ties to our conflicted advice project, and may have implications for the regulatory impact analysis. I hope others (not involved in the conflicted advice project) will be interested in this work as an example of how to examine the effects of rulemaking.

I do not anticipate having slides for the presentation; Matt will present from the paper.

# The Effect of Regulatory Regimes on the Provision of Retail Investment Advice<sup>\*,\*\*</sup>

*Working Paper*

## Abstract

Broker-dealers and investment advisers are two separate types of financial intermediaries subject to different regulatory regimes that can provide personalized investment advice about securities to investors. In this paper, I investigate whether differences between the broker-dealer regulatory regime and the investment adviser regulatory regime may be significant to retail investment advice by examining the principal transactions of investment grade municipal bonds. The results in this paper indicate that the advice retail investors receive may be dependent on the legal framework governing its provision. In particular, I find evidence of a potential relationship between the standards under which broker-dealers and investment advisers provide advice and the sale of investment grade municipal bonds to retail investors.

## I. Introduction

Investors can receive personalized investment advice about securities (or “personalized investment advice”) from two regulated types of financial intermediaries, broker-dealers and investment advisers, that may provide similar services but are subject to two different and

separate regulatory regimes. At the federal level, firms registered as broker-dealers are subject to the Securities Exchange Act of 1934 (or “Exchange Act”) and the rules thereunder, and the rules of self-regulatory organizations (or “SROs”), whereas firms registered as investment advisers are subject to the Investment Advisers Act of 1940 (or “Advisers Act”) and the rules thereunder. A firm registered as both a broker-dealer and an investment adviser (or “dual registrant firm”) may provide both brokerage and advisory services, and depending on whether the account is a brokerage account or an advisory account, be subject to the rules of either regulatory regime.<sup>1</sup>

Little to no research currently exists indicating whether differences between the broker-dealer and the investment adviser regulatory regimes can be significant to the advice retail investors receive in non-discretionary accounts.<sup>2</sup> In this paper, I investigate the effect of regulatory regimes by examining the principal transactions of investment grade municipal bonds.<sup>3</sup> I find evidence that suggests the regulatory regime, in particular the standards under which advice is given, may be significant to the advice retail investors receive.

I use investment grade municipal bonds in this study for two primary reasons. First, retail investors are major participants in the municipal bond market, individually investing in close to one-half of all municipal bonds outstanding.<sup>4</sup> The illiquidity and opacity of the municipal securities market (SEC; 2012a) also increases the importance of a financial agent

---

<sup>1</sup>A recent study by U.S. Securities and Exchange Commission (SEC) staff on investment advisers and broker-dealers as pursuant to Section 913 of the Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010 (or the “913 Study”) provides an in-depth review of the two regulatory regimes.

<sup>2</sup>The focus of this paper is the provision of personalized investment advice in non-discretionary accounts. A non-discretionary account does not provide a financial agent authority to transact securities without the consent of the account holder, whereas a discretionary account grants such authority. Recent estimates place the number of non-discretionary advisory accounts managed by federally registered investment advisers at 5 million, and the number of brokerage accounts at federally registered broker-dealers at 110 million. Both estimates include both institutional and retail accounts. Investment adviser information can be found at [www.sec.gov/foia/iareports/inva-archive.htm](http://www.sec.gov/foia/iareports/inva-archive.htm). The broker-dealer estimate includes both non-discretionary and discretionary accounts, and can be found in SEC (2011). I will refer to advisory clients with non-discretionary accounts as “advisory clients” or “clients,” brokerage customers with non-discretionary accounts as “brokerage customers” or “customers,” and brokerage customers and advisory clients generally as “investors.”

<sup>3</sup>A principal transaction is a transaction where the broker-dealer or investment adviser buys or sells securities for its own account.

<sup>4</sup>The estimate is as of the third quarter 2012, and can be found in the *Flow of Funds Accounts of the United States* statistical release, published by the Federal Reserve.

to provide advice to their customer or client.

Second, I use investment grade municipal bonds to incorporate a regulatory event into the empirical methodology. The regulatory event is the October 2007 adoption of a temporary SEC rule (or “temporary rule”). The temporary rule, among other things, established an alternative set of principal transaction disclosure and consent requirements under the Advisers Act for investment advisers also registered as broker-dealers. Prior to the temporary rule adoption, dual registrant firms typically did not engage in principal transactions with advisory clients, engaging in principal transactions with brokerage customers only.<sup>5</sup> Dual registrant firms adhering to the temporary rule (or “BA firms”) began engaging in principal transactions with both brokerage customers and advisory clients. Other firms, including all firms registered solely as broker-dealers and those dual registrant firms not adhering to the temporary rule (or “B firms”), continued to engage in principal transactions with brokerage customers only.<sup>6</sup> The temporary rule, still in effect at the time of this writing, does not permit a firm to rely on the rule for securities that it or an affiliated entity underwrites or issues except for non-convertible investment grade debt. I therefore use municipal bonds of investment grade only to be certain that the temporary rule can apply to all principal transactions in the empirical sample.<sup>7</sup>

The time period of the study is from January 2006 to December 2008. Broadly, I investigate whether regulatory regimes may be significant to the provision of personalized investment advice by comparing the change to the principal transactions of BA firms following the temporary rule adoption with the change to the principal transactions of B firms. If adherence to the temporary rule and the recommendation and transaction of investment

---

<sup>5</sup>In the initial temporary rule release, the SEC describes discussions with representatives of dual registrant firms regarding the difficulties of complying with the disclosure requirements under Section 206(3) of the Advisers Act (SEC; 2007). Firms explained that they typically did not engage in principal transactions with advisory clients as a result of the operationally restrictive disclosure requirements. The temporary rule has since been extended to December 31, 2014. See Section II.a for further explanation.

<sup>6</sup>I utilize municipal bond transaction data from the Municipal Securities Rulemaking Board (MSRB) Real-time Transaction Reporting System (RTRS). MSRB requires all broker-dealers and municipal securities dealers to report the transactions of municipal securities. Consequently, no firms in the sample are registered solely as investment advisers.

<sup>7</sup>See Section II.a for a further discussion of the temporary rule.

grade municipal bonds subject to the investment adviser regulatory regime is significant, then I may observe a difference in the change in principal transactions between BA firms and B firms as BA firms apply the temporary rule and the investment adviser regulatory regime to activities that would have otherwise been subject to only the broker-dealer regulatory regime.

As part of the empirical methodology, I specifically investigate whether the standard of conduct as required by federal and state law may be significant to the provision of personalized advice to retail investors.<sup>8</sup> At the federal level, an investment adviser is a fiduciary who is to serve in the best interests of its clients, including an obligation not to subordinate the clients' interests for their own and to disclose or eliminate all material conflicts of interest, whereas broker-dealers are required to deal fairly with their customers and in most instances are not considered a fiduciary. At the state level, broker-dealers may be subject to a fiduciary standard of conduct (SEC; 2011).<sup>9</sup>

I refine the broad comparison between BA firms and B firms to the state level, and compare the difference in the change in principal transactions between the two firm classifications between states where broker-dealers may be subject to additional standards of conduct that relate to a fiduciary standard of conduct (i.e., "fiduciary states") and states where broker-dealers are generally not subject to a fiduciary standard of conduct (i.e., "non-fiduciary states"). I assume, similar to the equity "home bias" (Coval and Moskowitz; 1999), that retail investors purchase the bonds of local or within-state municipalities.<sup>10</sup> By assumption, additional state standards of conduct would apply to the principal transactions of the municipal securities relating to the state.

Adherence to the temporary rule by BA firms in non-fiduciary states brought about the

---

<sup>8</sup>Other differences between the two regulatory regimes include disclosure requirements, supervisory and control procedures, continuing education requirements, and restrictions on advertising and other communications. The investment adviser regulatory regime is also largely principles-based and not predominately rules-based like the broker-dealer regulatory regime.

<sup>9</sup>See Section II.b for a further discussion of standards of conduct.

<sup>10</sup>Exemption from state and local taxes may also induce retail investors to purchase bonds of local or within-state municipalities (SEC; 2012a).

introduction of a fiduciary standard of conduct to the portion of investment grade municipal bond recommendations and transactions with advisory clients that would have otherwise been with brokerage customers, whereas adherence to the temporary rule by BA firms in fiduciary states did not result in a similar introduction of a fiduciary standard of conduct. Regardless of the presence of state fiduciary laws, the standard of conduct governing the recommendation and transaction of investment grade municipal bonds by B firms did not change following the temporary rule adoption as these firms continued to engage in principal transactions with brokerage customers only. Taken together, changes to the principal transactions of BA firms relative to B firms in fiduciary states may relate to the temporary rule and the investment adviser regulatory regime, but not a fiduciary standard of conduct, and changes to the principal transactions of BA firms relative to B firms in non-fiduciary states may relate to the temporary rule and the investment adviser regulatory regime including a fiduciary standard of conduct. An additional difference between BA firms and B firms in non-fiduciary states relative to fiduciary states, therefore, may relate to a fiduciary standard of conduct.

In the first set of tests, I investigate the effect of regulatory regimes on security recommendations by examining the sale of investment grade municipal bonds to retail investors. I do not find evidence indicating a difference in the change in sales to retail investors between BA firms and B firms following the temporary rule adoption in fiduciary states, but I do find evidence of additional sales to retail investors by BA firms relative to B firms in non-fiduciary states. Thus, I find evidence suggesting that a fiduciary standard of conduct may relate to the recommendation and sale of investment grade municipal bonds to retail investors, but no evidence that application of the temporary rule or other aspects of the investment adviser regulatory regime were also significant in explaining retail sales. In additional tests, I find that the relative increase in sales to retail investors by BA firms in non-fiduciary states was most significant soon after the temporary rule adoption. This result suggests that the increase in sales by BA firms in non-fiduciary states may relate more to the temporary rule

adoption and less to other factors which may also had an effect including events relating to the recent financial crisis.

In the second set of tests, I investigate the effect of regulatory regimes on the markup/markdown on, or the “transaction cost” (Harris and Piowar; 2006) of, investment grade municipal bonds. The implementation of policies and procedures to adhere to the temporary rule may have led to an increase in the compliance costs of BA firms. The increase in compliance costs may have resulted in higher transaction costs for retail investors who may have less access to pricing information than institutional investors (SEC; 2012a).<sup>11</sup> Research by Green, Hollifield, and Schürhoff (2007a) find evidence of differences in the level of informed trading between retail investors and institutional investors; transactions of smaller size, relating to retail investors, often exhibit less advantageous prices and a greater range of prices than the transactions of larger size, relating to institutional investors. I continue to distinguish bonds by state classification to investigate whether the additional increase in sales to retail investors by BA firms relative to B firms in non-fiduciary states was contemporaneous with an additional change in retail transaction cost.

I find evidence of an increase in transaction cost by BA firms relative to B firms following the temporary rule adoption in fiduciary states, but that the increase in transaction cost was not specific to retail transactions but also present in institutional transactions. Thus, I do not find evidence indicating that adherence to the temporary rule led specifically to additional retail investor transaction costs but instead find evidence of a more systematic change to the cost of all BA firm transactions. I also find evidence indicating an additional decrease in the cost of retail transactions by BA firms relative to B firms following the temporary rule adoption in non-fiduciary states. The time periods in which I find the additional decrease in transaction cost, however, only partially aligns with the time periods in which I find the additional increase in retail sales. Taken together, I do not find sufficient evidence in these

---

<sup>11</sup>See Section II.a for a further discussion of the requirements of the temporary rule. The markup/markdown bond traders set on firm inventory, especially for transactions that are more arm’s length, presumably would not be dependent on the account type of the investor and the regulatory regime under which the registered representative provides recommendations.

tests to conclude that changes to the regulatory regime stemming from the temporary rule adoption had an effect, either directly or indirectly, on the cost of retail transactions.

The results in this paper only provide suggestive evidence of the effects of regulatory regimes as a result of conducting tests at the firm level and not at the account level. Tests at the account level would require information describing the type of investor account, whether the transaction was solicited or unsolicited, and investor characteristics.<sup>12</sup> Other factors may be important in explaining the test results. I attempt to control for these other factors by comparing principal transactions between time periods, firms, and states, and controlling for differences between bonds, firms, and states with additional explanatory variables.

This is the first paper to empirically investigate the effect of regulatory regimes on the advice retail investors receive. The appropriate standard of conduct for broker-dealers and investment advisers is the subject of an ongoing debate among federal agencies, industry representatives, and investor advocacy groups. Some believe that a uniform fiduciary standard at the federal level applied across broker-dealers and investment advisers would provide additional retail investor protections, whereas others believe that a fiduciary standard of conduct applied to the broker-dealer regulatory regime would increase firm costs with little benefit and would ultimately result in reduced investor access to advice.<sup>13</sup> Examples of firm costs include ongoing costs relating to “back-office” functions, other compliance costs, and litigation costs.

Past research relating to the provision of financial advice typically investigates its net benefit or quality, and investigates only one type of financial agent or makes no distinction. Recent examples include Chalmers and Reuter (2011) who investigate the performance of

---

<sup>12</sup>The SEC recently requested data and other information relating to the benefits and costs of the standards of conduct and other obligations of broker-dealers and investment advisers (SEC; 2013). Examples of requested data and information include the types of services available to retail investors, the types of securities financial agents offer or recommend, and the costs to financial agents of providing personalized investment advice about securities.

<sup>13</sup>Comments to the 913 Study, including one by Oliver Wyman and the Securities Industry and Financial Markets Association, dated October 27, 2010, and one by State Farm VP Management Corporation, dated August 27, 2010, describe the potential costs of broker-dealers shifting to a fiduciary standard of conduct. All comment letters to the 913 Study and to a subsequent request for information and other data (SEC; 2013) can be found at <http://www.sec.gov/comments/4-606/4-606.shtml>.

brokerage customer retirement portfolios; and Mullainathan, Nöth, and Schoar (2011) who investigate the quality of investment advice provided by financial agents in an audit study.<sup>14</sup> These examples, as well as other research utilizing international data, indicate that retail investors do not always receive beneficial investment advice.<sup>15</sup> Other research finds conflicts of interest may partially determine the advice investors receive. For example, Bergstresser, Chalmers, and Tufano (2009) find that funds sold through an intermediary underperform funds sold directly to investors, and that the sale of underperforming funds may stem from conflicts of interest as a result of intermediary sales incentives.<sup>16</sup> I find that the advice investors receive may be partially determined by the regulatory regime governing its provision, and that investment advice should be evaluated in this respect.

Although the focus of this paper is on the provision of personalized investment advice, it also contributes to the municipal bond literature investigating municipal securities markets including Harris and Piwowar (2006); Green, Hollifield, and Schürhoff (2007a); Green, Hollifield, and Schürhoff (2007b); Green, Li, and Schürhoff (2010); Li and Schürhoff (2012); and Schultz (2012). I find evidence that the regulatory regime governing the provision of personalized investment advice may be an important determinant in the transaction of these securities, especially with respect to retail investors.

I organize the rest of the paper as follows: Section II provides additional regulatory background information, Section III describes the data, Section IV describes the tests of sales to retail investors, Section V describes the tests of transaction cost, and Section VI concludes.

---

<sup>14</sup>In relation to this paper, it is unclear whether Mullainathan et al. (2011) conduct audits of broker-dealers, investment advisers, or both. For instance, their use of the term “investment advisers” relates to “retail advisers whom the average citizen can access via their bank, independent brokerages, or investment advisory firms.” Thus, their definition of investment adviser seemingly incorporates both broker-dealers and investment advisers.

<sup>15</sup>Examples of research utilizing international data to investigate the quality of investment advice include Bhattacharya, Hackethal, Kaesler, Loos, and Meyer (2012); Fecht, Hackethal, and Karabulut (2010); Bluethgen, Meyer, and Hackethal (2008); Bluethgen, Gintschel, Hackethal, and Müller (2008); Karabulut (2011); Kramer (2009); and Kramer and Lensink (2009).

<sup>16</sup>Other work examining the distribution of mutual funds include Del Guercio and Reuter (2011); Del Guercio, Reuter, and Tkac (2010); and Christoffersen, Evans, and Musto (2013).

## II. Regulatory Background

This paper investigates the effect of regulatory regimes on the provision of personalized investment advice to retail investors. The null hypothesis is that the temporary rule and differences between the regulatory regimes do not matter to the principal transactions of investment grade municipal bonds relating to retail investors. The alternative hypothesis is that the temporary rule and differences between the regulatory regimes do matter to the principal transactions of investment grade municipal bonds relating to retail investors. Below, I provide additional background on the temporary rule, the investment adviser regulatory regime, and fiduciary standards of conduct. Figure 1 provides a diagram of the changes to the regulatory regime governing the principal transactions of investment grade municipal bonds by firm and state classification during the sample period.

### II.a *Changes to the Regulatory Regime Governing Principal Transactions*

The temporary rule establishes an alternative means for dual registrant firms to meet the requirements under Section 206(3) of the Advisers Act when engaging in principal transactions with non-discretionary advisory clients (SEC; 2007). The temporary rule, adopted in October 2007, was in direct response to a March 2007 court decision (*Financial Planning Association v. U.S. Securities and Exchange Commission*) overturning an SEC rule exempting broker-dealers from the definition of “investment adviser” when charging non-transaction based compensation (or “fee-based” brokerage accounts).<sup>17</sup>

Section 206(3) of the Advisers Act requires an investment adviser to provide written conflict-of-interest disclosure describing its role as principal when transacting securities from its own account and obtain client consent prior to transaction completion. The temporary rule provides a dual registrant firm the option of providing transaction-by-transaction disclosures verbally instead of in writing when engaging in principal transactions with non-

---

<sup>17</sup>Non-transaction based fees include fees based on the amount of assets under management. A consequence of the court decision was the requirement that dual registrant firms and broker-dealers treat fee-based brokerage accounts as advisory accounts, and that the firms as a result became subject to the restrictions of the Advisers Act when engaging in principal transactions. The temporary rule was adopted so that dually registered advisers could continue to engage in principal transactions with the customers of these accounts.

discretionary advisory clients as long as the firm satisfies additional requirements. Additional requirements of the temporary rule include the provision of a written prospective disclosure to clients describing the conflicts arising from principal transactions, acquisition of written revocable client consent prospectively authorizing such transactions, the provision of transaction-by-transaction confirmations, and the provision of annual reports itemizing the clients' principal transactions thereafter. The temporary rule does not relieve the obligations of the investment adviser regulatory regime including its fiduciary standard of conduct. Moreover, dual registrant firms engaging in principal transactions with advisory clients must also still adhere to the broker-dealer sales practice and best-execution obligations set by the SEC and SROs (SEC; 2007).

There are two primary changes to the regulatory regime governing the recommendation and transaction of investment grade municipal bonds stemming from adherence to the temporary rule which may have led to a change in sales to retail investors and retail transaction cost. The first primary change is the rules and requirements of the temporary rule itself. A dual registrant firm cannot rely on the rule for securities it or an affiliated entity underwrites or issues except for investment grade non-convertible debt. This restriction may have possibly resulted in a shift in sales from other securities to investment grade municipal bonds. Adherence to the temporary rule may have also led to an increase in compliance costs which may have been passed on to investors in the form of higher transaction costs. Compliance costs include the provision of written prospective disclosures, acquisition of written revocable client consent, and the implementation of systems to monitor adherence to the rule.

The second primary change is the application of the rules and requirements of the investment adviser regulatory regime, not including the rules and requirements of the temporary rule, to the recommendation and transaction of investment grade municipal bonds. The provision of personalized investment advice subject to the investment adviser regulatory regime, including a fiduciary standard of conduct, may have led to a change in security

recommendations retail investors receive and the cost of providing advice.<sup>18</sup>

Both primary changes may in some form have contributed to the results found below.<sup>19</sup> The results suggest that the introduction of a fiduciary standard of conduct to the recommendation and transaction of investment grade municipal bonds by BA firms in non-fiduciary states may have led to greater sales to retail investors.

## II.b *Standards of Conduct*

At the federal level, investment advisers are fiduciaries to their clients, whereas broker-dealers generally are not fiduciaries to their customers.<sup>20</sup> Both regulatory regimes provide protections to retail investors from abusive practices. Such protections include the obligation to seek best execution on customer or client orders, and the provision of investment advice which is suitable and in the best interests of their customers or clients. As part of a fiduciary duty, investment advisers also have an obligation to place the clients' interests in front of their own and to disclose or eliminate all material conflicts of interest.

In some states, broker-dealers are subject to a fiduciary standard of conduct (SEC; 2011). I assume that in practice standards of conduct, either directly or indirectly, are constraints to

---

<sup>18</sup>See footnote 13 and related text.

<sup>19</sup>Two other secondary changes may have also led to a change in security recommendations and transaction cost. The first of these secondary changes is the possible change in the number and the characteristics of investors with access to investment grade municipal bonds. As a result of the temporary rule, investment advisers at BA firms have greater ability to recommend certain securities from firm inventory to their advisory clients. If some advisory clients did not have access to these securities such as through additional brokerage accounts prior to the temporary rule adoption, then the adherence to the temporary rule may have changed the population of investors with access to these securities.

The second of these secondary changes is the change in the form of financial agent compensation for those customers transferring assets from fee-based brokerage accounts to commission-based brokerage accounts. Financial agents compensated with commissions may be more inclined to recommend securities not intended to be invested in long-term to collect transaction based fees. On the other hand, financial agents compensated with fees based on the amount of assets under management may be more inclined to recommend securities intended to be invested in long-term to avoid transaction costs.

Both the possible change in the population of investors with access to securities from firm inventory and the form of financial agent compensation would have effects that are more ongoing and that are independent of state fiduciary laws. The results, especially with respect to sales to retail investors, instead indicate that changes to the principal transactions of investment grade municipal bonds is dependent on state classification. It is possible, however, that these secondary changes also had an influence on the test results.

<sup>20</sup>There are differing interpretations as to when broker-dealers have a fiduciary obligation to their customers. The ambiguity stems from a lack of litigated cases impeding the development of case law, variation in customer contracts, and inconsistencies between states (Laby; 2010).

the investment advice financial agents provide. Although firms may not implement control and compliance systems or procedures to address differences in state law, state law may still be important to the provision of personalized investment advice. For instance, in case of customer dispute, federal courts would look to state law to determine the fiduciary obligations of a broker-dealer (Laby; 2010), and arbitrators can apply state laws to determine awards in case of customer arbitration.<sup>21</sup>

### III. Data Description

I obtain information describing the business of dual registrant firms and broker-dealers from public SEC filings, municipal bond characteristics from the Mergent Municipal Bond Securities Database (Mergent dataset) and SDC Platinum, municipal bond transaction data from the MSRB RTRS dataset, and state information from various sources.

The time period of study is from January 2006 to December 2008. I use bonds with offering dates between January 2006 and December 2006, and between October 2007 and September 2008. I choose a short time period to accurately test the change in municipal bond transactions while avoiding to the fullest extent possible the impact of the global financial crisis of 2008. I do not include municipal bonds with offering dates within 60 trading days of the court decision, from January 2007 to March 2007, and between the court decision and the temporary rule adoption, from March 2007 to September 2007, due to the legal uncertainty of the time period. Similar to Green et al. (2007a), my sample includes only bond transactions occurring within 60 trading days of the bond offering date. The 60 trading day window allows me to incorporate the municipal bonds that are the most frequently traded and to limit the number of municipal bonds with trading periods that overlap either the court decision or the temporary rule adoption.

---

<sup>21</sup>Customers of broker-dealers and dual registrant firms, including the advisory clients at dual registrant firms, typically sign pre-dispute arbitration agreements with their financial agent. Training materials from the Financial Industry Regulatory Authority (FINRA), which operates the largest dispute resolution program in the securities industry, guides arbitrators to seek guidance in most cases from the parties involved to determine the applicable law or laws. See *The Neutral Corner*, Volume 3 (2010), published by FINRA, and *Basic Arbitrator Training*, also published by FINRA, for training materials.

### III.a *Broker-Dealer and Dual Registrant Firm Information*

The initial sample of broker-dealers (and dual registrant firms) includes all broker-dealers that engaged in a municipal bond transaction during the sample period and that is reported in the MSRB RTRS dataset. I require all firms to file annual SEC Form X-17A-5 audited reports with information encompassing the sample period to ensure that the sample of broker-dealers does not change from before the court decision to after the temporary rule adoption. Form X-17A-5 is a financial and operational report that must be filed by all broker-dealers registered with the SEC, and can be found on the SEC's EDGAR system. I obtain information describing the firm's investment adviser business, if any, from annual SEC Form ADV filings. Investment advisers and dual registrant firms file Form ADV with the SEC to provide general information including the types of clients, compensation arrangements, and advisory activities. Past Form ADV filings can be found on the SEC's Investment Adviser Public Disclosure website.

I classify a firm as a BA firm if it files Form ADV, reports actively engaging in business as a broker-dealer, reports a positive number of non-discretionary advisory accounts, and reports that it engages in principal transactions with advisory clients. BA firms are only potentially adhering to the temporary rule because firms filing Form ADV do not specifically acknowledge adherence to the rule. A B firm either does not file Form ADV, does not report actively engaging in business as a broker-dealer, does not report a positive number of non-discretionary clients, or does not report that it engages in principal transactions with advisory clients. B firms, therefore, could not be relying on the temporary rule. Because firms generally did not engage in principal transactions with non-discretionary advisory clients prior to the temporary rule adoption, I classify firms using information from the time period following the rule adoption only. To obtain a more direct comparison between firms either adhering to the temporary rule or not adhering to the rule, I exclude firms that are not solely classified as either a BA firm or a B firm as of December 2007 and December 2008. There are 95 BA firms and 1,475 B firms that meet all sample requirements.

### III.b *Municipal Bond Characteristics*

I obtain bond characteristic information from the Mergent dataset. The Mergent dataset provides security and issue information for 484,256 individual bonds with offering dates between July 2005 and December 2008. I extract bond information from the Mergent dataset including the type and frequency of coupon payments, put options, call options, sinking fund provisions, non-standard interest frequency or interest calculation, credit enhancements, tax status, the type of debt-paying assets, and the use of proceeds. I obtain bond ratings information from SDC Platinum.

I exclude 26,075 individual bonds from the initial sample with missing offering price information, missing or inaccurate total offering amount information, remarketed bonds, and bonds not relating to any of the 50 states or the District of Columbia.<sup>22</sup> To incorporate the Harris and Piwovar (2006) bond model in my analysis, I exclude 16,586 individual bonds with a derivative or warrant feature, and 8,346 individual bonds with non-standard coupon payments (adjustable, floating, flexible, variable, inverse, or index-linked coupons). I also exclude 80,986 individual bonds that are either designated as non-investment grade or with missing ratings information in SDC Platinum to ensure that the temporary rule can apply to all bonds in the sample. There are 352,309 bonds remaining in the sample. Bond issuances are spread evenly throughout the sample period. There are 109,168 investment grade municipal bonds meeting sample requirements with offering dates between January 2006 and December 2006, and there are 89,543 investment grade municipal bonds meeting sample requirements with offering dates between October 2007 and September 2008.

### III.c *State Information*

I obtain state law information from Finke and Langdon (2012) who classify states and the District of Columbia into one of three categories based on whether broker-dealers are subject to a fiduciary standard of conduct, a quasi-fiduciary standard of conduct, or no

---

<sup>22</sup>I search for inaccurate total offering amount information by examining individual bonds with total offering amount less than denomination amount. Often these securities are zero-coupon bonds selling at a discount. However, it can also be indicative of data error. I find only a few such examples.

fiduciary standard of conduct. They base their classification scheme on court decisions and state regulations. It is unclear the extent to which state level fiduciary or quasi-fiduciary standards of conduct relate to the fiduciary standard of conduct of the investment adviser regulatory regime. For instance, Finke and Langdon (2012) note that some quasi-fiduciary states “impose a standard higher than the suitability standard imposed by FINRA for non-discretionary accounts.”

From the classification of Finke and Langdon (2012), I define a fiduciary state as a state where broker-dealers are subject to a fiduciary or quasi-fiduciary standard of conduct, and a non-fiduciary state as a state where generally broker-dealers are not subject to a fiduciary standard of conduct. State classifications relate to the standards of conduct governing the provision of advice in non-discretionary accounts. The difference between states is whether broker-dealers are either subject to additional standards of conduct that seemingly relate to a fiduciary standard or are generally not subject to a fiduciary standard of conduct. Table 1 presents a listing of fiduciary states and non-fiduciary states by geographic region. There are 37 fiduciary states and 14 non-fiduciary states. A little more than a quarter of bond issues relate to non-fiduciary states.

I obtain state income information from the U.S. Census Bureau, gross state product statistics from the Bureau of Economic Statistics, and tax information from the Federation of Tax Administrators. I incorporate the information in the regressions below to control for state level economic differences.

#### III.d *Municipal Bond Transaction Data*

I obtain municipal bond transaction data from the MSRB RTRS dataset. The dataset contains information for all municipal bond transactions from July 2005 to March 2009. Each observation provides information regarding bond cusip, trade date, time of trade, settlement date, bond price, par value, and transaction commissions. The dataset also contains fields identifying the transacting broker or brokers, the type of transaction (between two dealers or a dealer and a customer, sale or purchase), and dealer capacity (principal or agent). The

dataset does not contain information describing the type of investor engaging in customer transactions (institutional or retail), the type of customer account (brokerage or advisory), and whether the transaction was solicited or unsolicited. There are 5,382,087 observations relating to the principal transactions of sample investment grade municipal bonds in the final sample. In Appendix A.1, I describe measures to clean the dataset for missing or inaccurate trade dates, inaccurate prices, managed account transactions, and other possible data errors.

Table 2 presents the amount of investment grade municipal bond customer principal transactions relating to firms in the final sample. The table includes four panels presenting the total number and value of all customer transactions (Panel A), the total number and value of all sales to customers (Panel B), the total number and value of all sales to customers less than or equal to \$50,000 (Panel C), and the total number and value of all sales to customers less than or equal to \$20,000 (Panel D). I use sales to customers less than or equal to \$50,000 and less than or equal to \$20,000 to proxy for sales to retail investors. In each panel the table also presents transaction information by firm classification. In no year did B firms engage in more customer transactions or sales to customers than BA firms. Considering the number of BA firms to B firms, the comparison in customer transactions and sales highlights the difference in trading activity between the two classifications of firms.

## IV. Tests of Municipal Bond Sales

### IV.a *Empirical Model*

In the first set of tests, I investigate the effect of regulatory regimes on security recommendations by examining the sale of investment grade municipal bonds to retail investors. I define a transaction as a “retail transaction” if the par amount is less than or equal to \$50,000. Alternatively, I define a transaction as a retail transaction if the par amount is less than or equal to \$20,000. Evidence by Green et al. (2007a) indicates that sales to customers of smaller par amount exhibit greater average markups and intraday price dispersion than sales to customers of larger par amount. The greater price dispersion among smaller trans-

actions is akin to a set of investors, such as retail investors, with varying access to pricing information.

I estimate regressions at the individual bond level, measuring the sale of investment grade municipal bonds to retail investors with *ParSale*, equal to the net par sold to retail investors, and *NumSale*, equal to the net number of sales to retail investors. I include two sets of explanatory variables in the regression. Similar to the difference-in-difference-in-differences empirical methodology, the first set of explanatory variables controls for the time period of the bond offering date (either before the court decision or after the temporary rule adoption), the classifications of firms engaging in customer sales (either BA or B), and the state classification relating to the bond (either non-fiduciary or fiduciary). The variables include

- $I^{TR}$  - an indicator variable equal to 1 if the offering date of the bond is after the temporary rule adoption, and 0 if the offering date of the bond is before the court decision
- $\overline{I^{BA}}$  - a continuous variable with a range between 0 and 1 equal to the average of  $I^{BA}$  (an indicator variable equal to 1 if a BA firm engages in the bond sale, and 0 if a B firm engages in the bond sale) for all firms engaging in at least one customer sale regardless of par amount<sup>23</sup>
- $I^{NF}$  - an indicator variable equal to 1 if the bond relates to a non-fiduciary state, and 0 if the bond relates to a fiduciary state
- interaction terms between  $I^{TR}$ ,  $\overline{I^{BA}}$ , and  $I^{NF}$  -  $I^{TR} \times \overline{I^{BA}}$ ,  $I^{TR} \times I^{NF}$ ,  $\overline{I^{BA}} \times I^{NF}$ , and  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$

---

<sup>23</sup>I weight the average with the total par amount of firm customer sales. I average  $I^{BA}$  using all firms engaging in at least one customer sale regardless of transaction size instead of firms engaging in at least one retail sale to measure the classifications of firms that could have engaged in a retail sale.  $\overline{I^{BA}}$  is undefined for bonds with no customer sales. These bonds are therefore not in the regression sample.

The second set of explanatory variables controls for differences between firms, bonds, and states that could also be important in explaining retail sales. The potential amount of bond sales to retail investors should relate to the trading activity of the firms engaging in customer sales. I control for firm trading activity with a quarterly measure of net firm customer sales ( $CSales$ ) averaged at the bond level similar to  $\overline{I^{BA}}$  ( $\overline{CSales}$ ). I also control for differences between bonds by including variables describing the total par offering amount ( $TotPar$ ), bond maturity ( $Maturity$ ), and other bond characteristics (see Appendix A.2).

Assuming that retail investors purchase the bonds of within-state municipalities, economic differences between states could also be important in explaining retail sales. I control for differences in income distributions with annual median income ( $StateMedInc$ ) and annual income standard error ( $StateIncSE$ ). I also control for differences in investor demand ( $StateDmnd$ ) equal to the natural log of the product of state GDP and the maximum of personal, corporate, and bank state tax rates (Harris and Piwowar; 2006). Lastly I include aggregate state level total par offering amount ( $StateTotPar$ ) to control for recent bond issuance activity.

I rescale  $ParSale$ ,  $\overline{CSales}$ ,  $TotPar$ ,  $StateMedInc$ ,  $StateIncSE$ , and  $StateTotPar$ , by dividing each variable by 10,000 and then taking the natural log of one plus the scaled value. I also rescale  $NumSale$  and  $Maturity$  by taking the natural log of one plus its value. I lag  $\overline{CSales}$ ,  $TotPar$ ,  $StateTotPar$ ,  $StateMedInc$ ,  $StateIncSE$ , and  $StateDmnd$  to the quarter or year prior to the bond offering date. In equation form, I estimate the following regression

$$\begin{aligned}
Y_i = & \beta_0 + \beta_1 I_i^{TR} + \beta_2 \overline{I_i^{BA}} + \beta_3 \left( I_i^{TR} \times \overline{I_i^{BA}} \right) \\
& + \beta_4 I_i^{NF} + \beta_5 \left( I_i^{TR} \times I_i^{NF} \right) + \beta_6 \left( \overline{I_i^{BA}} \times I_i^{NF} \right) \\
& + \beta_7 \left( I_i^{TR} \times \overline{I_i^{BA}} \times I_i^{NF} \right) + \boldsymbol{\beta} \mathbf{X}_i + \varepsilon_i
\end{aligned} \tag{1}$$

where  $Y$  represents either  $ParSale$  or  $NumSale$ ,  $\beta$  represents model parameters,  $\mathbf{X}$  represents

the set of additional control variables,  $\varepsilon$  represents model error, and  $i$  indexes bonds.<sup>24</sup> I estimate both regressions using a tobit model that specifies censored observations at 0. I exclude individual bond observations with net par sold or net number of sales less than 0. With these observations, I am likely either missing transactions as a result of excluding firms not meeting sample requirements or miscategorizing transactions as relating to either retail or institutional customers.<sup>25</sup> I calculate  $t$ -statistics with standard errors clustered at the 6-digit cusip level to account for correlations in the error term at the level of the municipality. There are 157,116 observations relating to individual bonds in the regressions describing net sales less than or equal to \$50,000, and there are 157,979 observations relating to individual bonds in the regressions describing net sales less than or equal to \$20,000.

Two of the explanatory variables are of particular interest. The first variable of interest,  $I^{TR} \times \overline{I^{BA}}$ , controls for the change in retail sales following the temporary rule adoption in fiduciary states (setting  $I^{NF}$  equal to 0) dependent on the classification of firms engaging in bond customer sales. A significant regression parameter estimate corresponding to this variable indicates that the retail sale of a bond following the temporary rule adoption is dependent on the classifications of firms engaging in customer sales, and suggests that the temporary rule or the investment adviser regulatory regime, but not a fiduciary standard of conduct, may influence security recommendations.

The second variable of interest,  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$ , controls for the additional change in retail sales following the temporary rule adoption in non-fiduciary states (setting  $I^{NF}$  equal to 1) dependent on the classification of firms engaging in customer sales. A significant regression parameter estimate corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  indicates that there is an additional effect following the temporary rule adoption in the relationship between retail sales and the classifications of firms engaging in customer sales in non-fiduciary states, and

---

<sup>24</sup>I also include state fixed effects in an alternative regression specification. I find little difference in the results.

<sup>25</sup>I exclude 3,444 observations with either negative net retail or institutional sales (see Section IV.c) when the retail transaction threshold is set at \$50,000, and I exclude 2,473 observations with either negative net retail or institutional sales when the retail transaction threshold is set at \$20,000.

suggests that a fiduciary standard of conduct may influence security recommendations.

#### IV.b *Results*

Table 3a presents model estimates for regression equation (1) when the retail transaction threshold is set at \$50,000, and Table 3b presents model estimates for regression equation (1) when the retail transaction threshold is set at \$20,000. I find that the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}}$  are insignificant in all regressions, whereas the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  are positive and significant at the 95% confidence level in all regressions. The sign and significance of the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  indicate an additional increase in retail sales by BA firms relative to B firms in non-fiduciary states following the temporary rule adoption, and suggests that a fiduciary standard of conduct may relate to the retail sale of investment grade municipal bonds. The insignificance of the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}}$  indicate that I do not find evidence in this empirical setting that the temporary rule or other aspects of the investment adviser regulatory regime may also explain retail sales following the rule adoption.

Among the other control variables, I find that average firm customer sales, bond total par offering amount, and bond maturity are positive and significant determinants of retail sales, whereas other bond characteristics including sinking fund provisions, odd interest payment frequency, and federal and state taxes are negative and significant. In general, the sign and significance of the bond characteristic variables reflects the inclination of financial agents to avoid recommending and selling municipal bonds to retail investors with disadvantageous or complex features. I also find that state median income and investor demand are also positive and significant determinants of retail sales.

I estimate the possible economic significance of a fiduciary standard of conduct by subtracting the change in the unconditional expected value of *ParSale* and *NumSale* for a bond sold entirely by BA firms in non-fiduciary states with (a) the same change for a bond sold entirely by B firms in non-fiduciary states, and with (b) the same change for a bond sold

entirely by BA firms in fiduciary states. I calculate the unconditional expected amount of retail sales for a bond sold either entirely by BA firms or by B firms to obtain the most direct comparison between firm and state classifications as possible. In equation form, I estimate

$$\underbrace{(E[Y_{1,1,1}] - E[Y_{0,1,1}])}_{\Delta \text{ BA/non-fiduciary}} - \underbrace{(E[Y_{1,0,1}] - E[Y_{0,0,1}])}_{\Delta \text{ B/non-fiduciary}} - \underbrace{(E[Y_{1,1,0}] - E[Y_{0,1,0}])}_{\Delta \text{ BA/fiduciary}}$$

where  $Y$  represents either *ParSale* or *NumSale*, the first subindex of  $Y$  represents the value of  $I^{TR}$ , the second subindex of  $Y$  represents the value of  $\overline{I^{BA}}$ , and the third subindex of  $Y$  represents the value of  $I^{NF}$ . The first comparison, retail sales relating to B firms in non-fiduciary states, accounts for the change in expected retail sales in non-fiduciary states, and the second comparison, retail sales relating to BA firms in fiduciary states, accounts for the change in expected retail sales by BA firms. Neither comparison accounts for the change in bond sales as a result of an introduction of a fiduciary standard of conduct, such as with BA firms in non-fiduciary states, to a portion of security recommendations that would otherwise have not been subject to such a standard. The full difference, therefore, measures the potential effect of a fiduciary standard of conduct to the recommendation and sale of investment grade municipal bonds. To obtain a relative measure, I benchmark the full difference to the unconditional expected value of the dependent variables for a bond sold entirely by BA firms in non-fiduciary states prior to the court decision ( $E[Y_{0,1,1}]$ ).

Table 4 presents the estimates of economic significance. When the retail transaction threshold is set at \$50,000, I find that a fiduciary standard of conduct may lead to an 8.3% increase in *ParSale* and a 9.2% increase in *NumSale* per bond, and when the retail transaction threshold is set at \$20,000, I find that a fiduciary standard of conduct may lead to a 16.4% increase in *ParSale* and a 16.0% increase in *NumSale* per bond. The influence of a fiduciary standard of conduct on security recommendations does not necessarily imply that the recommendations are necessarily “better,” but does imply that the recommendations are different. For example, there is a trade-off between having securities in brokerage accounts

where generally the financial agent has no continuing obligation after providing investment advice but also does not charge ongoing fees, and having securities in advisory accounts where more typically the financial agent has agreed to a continuing obligation after providing investment advice but charges fees based on assets under management.<sup>26</sup> The decision to have long term assets in advisory accounts instead of brokerage accounts may therefore prove to be more costly in the long run.

#### IV.c *Extensions*

The time period of the study overlaps events relating to the recent financial crisis which may also have had an effect on the recommendation and sale of investment grade municipal bonds. For instance, bonds with offering dates from July 2008 to September 2008 have 60 trading day windows that overlap the bankruptcy of Lehman Brothers in September 2008. To investigate whether other events may have also led to a change in retail sales following the temporary rule adoption, I partition the full regression sample into calendar quarters and reestimate regression equation (1). That is, I reestimate regression equation (1) using bonds with offering dates either in the fourth quarter of 2006 and in the fourth quarter of 2007 (the first quarter following the temporary rule adoption), in the first quarter of 2006 and in the first quarter of 2008, in the second quarter of 2006 and in the second quarter of 2008, or in the third quarter of 2006 and the third quarter of 2008 (the fourth quarter following the temporary rule adoption). I partition the regression sample by calendar quarter to control for the effect of seasonal trends. If the results in the first set of tests relate to the adoption of the temporary rule, then I should find similar evidence either soon after the temporary rule adoption or throughout the post-event time period.

Table 5a presents the abbreviated regression results when the retail transaction threshold is set at \$50,000, and Table 5b presents the abbreviated regression results when the retail

---

<sup>26</sup>Whether a broker-dealer or investment adviser has continuing obligations is dependent on the contractual arrangement with the customer. Over 95% of investment advisers charge fees based on the percentage of assets under management and less than 10% of investment advisers charge transaction based compensation (SEC; 2011).

transaction threshold is set at \$20,000. I find that the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  are positive and statistically significant in the regressions describing the retail sale of bonds with offering dates in the first quarter and in the second quarter following the temporary rule adoption, and are insignificant in the regressions describing the retail sale of bonds with offering dates in the third quarter and in the fourth quarter. These results indicate that if a fiduciary standard of conduct was significant in resulting in additional investment grade municipal bond retail sales, then it was most significant shortly after the rule adoption and before the potential influence of other events. I also only find strong evidence that  $I^{TR} \times \overline{I^{BA}}$  is statistically significant in the regressions describing retail sales of bonds with offering dates in the second quarter. Thus, I do not find evidence of a trend that could relate to the temporary rule or other aspects of the investment adviser regulatory regime.

As a comparison to retail sales, I reestimate regression equation (1) but instead model institutional sales. I define a customer transaction as an “institutional transaction” if the par amount is strictly greater than \$50,000. The additional increase in retail sales by BA firms relative to B firms in non-fiduciary states following the temporary rule adoption could be the result of a relative overall increase in the sale of these securities by BA firms and may not pertain specifically to retail investors. I reestimate regression equation (1) using the full regression sample and the regression sample partitioned by calendar quarter.

Table 6 presents the regression results when I use the full regression sample. I find that the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}}$  are positive and statistically significant in both regressions, and that only in the regression describing *ParSale* is the parameter estimate corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  statistically significant albeit negative. These results suggest that although there was an increase in institutional sales by BA firms relative to B firms following the temporary rule adoption, the change in institutional sales dependent on the classification of firms engaging in customer sales was more positive for bonds relating to fiduciary states than to non-fiduciary states. Although a relationship potentially exists

between retail and institutional sales, these results suggest that the relative increase in retail sales by BA firms in non-fiduciary states is not reflective of an overall trend relating to these firms and securities. Table 7 presents the abbreviated regression results when I separate bond observations by calendar quarter. Similar to the quarterly regressions describing retail sales, and further evidence of a potential relationship between retail and institutional sales, I find that parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}}$  and  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  are significant in the regressions describing the institutional sale of bonds with offering dates in the first quarter and in the second quarter following the temporary rule adoption, and insignificant in the regressions describing the institutional sale of bonds with offering dates in the third quarter and in the fourth quarter.

## V. Tests of Retail Transaction Cost

### V.a *Empirical Model*

In the second set of tests, I investigate the effect of regulatory regimes on the transaction cost of investment grade municipal bonds. I utilize the Harris and Piwowar (2006) methodology to measure transaction cost.<sup>27</sup> The model describes bond price as a function of bond value, transaction cost, and interdealer price concession. The authors model transaction cost as a three term function. From this cost function, I obtain estimates of transaction cost at the individual bond level for transactions of par value equal to \$20,000, \$50,000, \$100,000, and \$1,000,000. Cost estimates of transactions of par value equal to \$20,000 and \$50,000 relate more to the cost of retail transactions, and cost estimates of transactions of par value equal to \$100,000 and \$1,000,000 relate more to the cost of institutional transactions.

To investigate the effect of regulatory regimes on transaction cost, I regress estimates of transaction cost on variables controlling for firm classification, the time period of the bond offering, the state classification relating to the bond, and other potential determinants of transaction cost including bond characteristics and state level variables. The additional variables in the cost function are similar to the explanatory variables that I use to explain

---

<sup>27</sup>See Appendix A.3 for a description of the methodology.

customer sales in Section IV. However, I respecify  $\overline{I^{BA}}$  and  $\overline{CSales}$  to take into consideration the utilization of each customer transaction to estimate transaction cost. I now define the variable  $\overline{I^{BA}}$  as the non-weighted average of  $I^{BA}$  of all customer transactions, both purchases and sales, and  $\overline{CSales}$  as the non-weighted average of the aggregate par amount of all firm customer transactions ( $\overline{CTrans}$ ). I estimate the following regression

$$\begin{aligned} \widehat{C}_{S,i} = & \beta_0 + \beta_1 I_i^{TR} + \beta_2 \overline{I_i^{BA}} + \beta_3 \left( I_i^{TR} \times \overline{I_i^{BA}} \right) \\ & + \beta_4 I_i^{NF} + \beta_5 \left( I_i^{TR} \times I_i^{NF} \right) + \beta_6 \left( \overline{I_i^{BA}} \times I_i^{NF} \right) \\ & + \beta_7 \left( I_i^{TR} \times \overline{I_i^{BA}} \times I_i^{NF} \right) + \beta \mathbf{X}_i + \varepsilon_i \end{aligned} \quad (2)$$

where  $\widehat{C}$  represents cost estimates and  $S$  represents transaction size.<sup>28</sup> I incorporate the Bayesian shrinkage estimator of Harris and Piwovar (2006) to calculate the variance of cost estimates, and weight regression observations with the inverse of the variances. I calculate  $t$ -statistics with standard errors clustered at the 6-digit cusip level to account for correlations in the error term at the level of the municipality. There are 57,540 individual bonds that meet the requirements of the Harris and Piwovar (2006) model, and 57,500 observations relating to individual bonds that are in the regression sample.

Similar to the regressions in Section IV, the two variables of interest are  $I^{TR} \times \overline{I^{BA}}$  and  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$ . A significant regression parameter estimate corresponding to  $I^{TR} \times \overline{I^{BA}}$  indicates a change in transaction cost following the temporary rule adoption in fiduciary states dependent on the classification of firms engaging in bond customer transactions. Significance of this variable suggests, especially for estimates of retail transaction cost, that the costs relating to compliance of the temporary rule may have resulted in an increase in the cost of BA firm transactions. A significant regression parameter corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  indicates an additional change in transaction cost in non-fiduciary states following the temporary rule adoption dependent on the classification of firms engaging in

---

<sup>28</sup>I also include state fixed effects in an alternative regression specification. I find little difference in the results.

bond customer transactions. The results in the first set of tests indicate an additional increase in retail sales by BA firms relative to B firms in non-fiduciary states. It is possible that this additional increase in retail sales is also contemporaneous with a change in retail transaction cost.

## V.b *Results*

Similar to Harris and Piwowar (2006), I find that customer transaction cost decreases as transaction size increases. For example, average transaction cost weighted by the inverse of cost estimate variance ranges from 87 basis points for transactions of \$20,000, to 77 basis points for transactions of \$50,000, to 63 basis points for transactions of \$100,000, and to 21 basis points for transactions of \$1,000,000. These estimates are similar to Harris and Piwowar (2006) who find that average customer transaction cost ranges from 99 basis points for transactions of \$20,000, to 77 basis points for transactions of \$50,000, to 62 basis points for transactions of \$100,000, and to 24 basis points for transactions of \$1,000,000.

Table 8a presents model estimates for regression equation (2) describing the cost of transactions of par value equal to \$20,000 and \$50,000, and Table 8b presents model estimates for regression equation (2) describing the cost of transactions of par value equal to \$100,000 and \$1,000,000. I find that  $I^{TR} \times \overline{I^{BA}}$  is a positive and significant determinant of transaction cost in all four regressions, and that  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  is a negative and significant determinant in regressions describing the cost of transactions of par value equal to \$20,000, \$50,000, and \$100,000. The significance and similar magnitude of parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}}$  in all four regressions suggests that the additional change in transaction cost dependent on the classification of firms engaging in customer transactions may not relate to the temporary rule but instead to other factors that would have a more systematic effect on the cost of all transactions regardless of size. The sign and significance of the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  indicate an additional decrease in retail transaction cost for those bonds relating to non-fiduciary states and with a greater proportion of transactions by BA firms. Although this additional decrease is greater for transactions relat-

ing more to retail investors, the tests below indicate that it may not relate to the additional increase in retail sales found in Section IV.

Among the other control variables, bond characteristics that are positive and significant determinants of retail transaction cost include bond maturity, optional call schedules, odd interest payment frequency, and state median income. Credit enhancements are also positively and significantly related to retail transaction cost, but more so prior to the temporary rule adoption than after; although the credit enhancement indicator variable is positive and statistically significant, the interaction term between the credit enhancement indicator variable and  $I^{TR}$  is negative and statistically significant. Retail transaction cost is also lower for bonds with total par offering amount. The sign and significance of many of the control variables are similar to the findings of Harris and Piwowar (2006).

### *V.c Extension*

To investigate whether other events could relate to the changes in transaction cost following the temporary rule adoption, I again partition the full regression sample into calendar quarters and reestimate regression equation (2). In each one of the regressions, the variables of interest are again  $I^{TR} \times \overline{I^{BA}}$  and  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$ .

Table 9a presents the abbreviated regression results describing the cost of transactions of par value equal to \$20,000 and \$50,000, and Table 9b presents the abbreviated regression results describing the cost of transactions of par value equal to \$100,000 and \$1,000,000. I find that  $I^{TR} \times \overline{I^{BA}}$  is positive in all regressions, and significant in at least one regression relating to each transaction size and quarter. On the other hand, I find that  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  is negative and statistically significant in the regressions describing the transaction cost of bonds with offering dates in the second quarter and in the third quarter following the temporary rule adoption. This result indicates that the time periods in which I find an additional decrease in retail transaction cost by BA firms relative to B firms in non-fiduciary states only partially overlaps the time periods in which I find an additional increase in retail sales. These two results, therefore, may not be related. Taken together, I do not find

enough evidence to conclude that changes to the regulatory regime governing the principal transactions of investment grade municipal bonds relate to changes in transaction cost that is specific to retail investors.

## VI. Conclusion

This paper is a first step in determining the importance of regulatory regimes to the provision of personalized investment advice about securities to retail investors. Broker-dealers and investment advisers may provide many of the same services yet are subject to two different legal frameworks. The results in this paper indicate that differences between the two regulatory regimes may be important to the advice retail investors receive.

This paper investigates just one aspect of the many services broker-dealers and investment advisers may provide. Although I utilize transaction level data, regulatory events, and additional information like state laws, the lack of account level information limits the efficacy of the empirical methodology. Both regulators and researchers would greatly benefit from information describing investor demographics, account characteristics, the types of security investments, and security returns. Such information can not only provide a more meaningful description of a market characterized by information asymmetries, but also an industry that is vital to the financial well-being of many retail investors.

# Appendix

## A.1 *MSRB RTRS Dataset*

There are 35,169,982 transaction observations in the MSRB dataset from July 2005 to December 2008.<sup>29</sup> The dataset reduces to 11,065,403 observations after I exclude bonds with missing issuance or bond information on Mergent, and bonds not meeting sample requirements (see Section II.b), and further reduces to 6,046,632 observations after I exclude transactions with missing trade date, time of trade, transaction price, and par amount information; inaccurate trade date information; and transactions with trade dates not within 60 trading days of the bond offering date.

I also exclude managed account transactions, or where an intermediary acts on the behalf of multiple customers and allocates securities across accounts. These transactions may appear in the dataset as a contemporaneous purchase and then sale to multiple customers at the same time and price with equal par amounts. There are 5,993,465 observations after combining multiple transactions with these similarities to one.

I identify observations with inaccurate transaction prices by comparing the price of an observation to the offering price of the bond and the prices of transactions that immediately precede and follow the observation. For each comparison price (relating to the offering price, the transaction price immediately preceding the observation, and the transaction price immediately following the observation), I calculate a measure equal to the absolute value of the observation price minus the comparison price, all divided by the observation price. I then separately rank each one the three sets of comparison measures. I classify a price as inaccurate with respect to one of the three comparison prices if it ranks in the top 0.05%. I choose 0.05% by examining outliers in the remaining sample when the threshold ranges from 0.01% to 0.1%.

---

<sup>29</sup>After August 2007, the original dataset separates each interdealer transaction into two observations. However, the original dataset also contains a field assigning each interdealer transaction an identification code. I use the identification code to combine the duplicate interdealer transactions. If I cannot match interdealer transactions on identification code, then I match on trade information. I assume the remaining interdealer transactions are non-duplicative.

I delete all individual observations from the sample where each one of the three comparison measures classify as inaccurate and the prices of the transactions immediately following and preceding the observation are also not inaccurate with respect to the next closest transaction. I also exclude all observations relating to a particular bond if an individual observation is inaccurate with respect to the offering price but I cannot delete it from the sample. This can occur when bond prices are inaccurate with respect to the offering price in consecutive transactions. I exclude 5,911 observations from the sample using this methodology, and I also exclude an additional 40,487 observations with bond price less than or equal to 0.01.

I also clean the dataset using par value traded information. I exclude observations with par value traded greater than total par offering amount. I also identify duplicate observations in the dataset by aggregating the par value traded to customers. I consider identical observations to be duplicate if the total par value sold to customer accounts is greater than the total par offering amount by the par value traded. I exclude 369 transactions that are duplicate and 2,209 observations with par traded greater than total par offering amount. Past researchers have taken additional steps to refine the MSRB transaction dataset. The additional refinements, however, impose additional assumptions on the dataset. There are 5,944,489 observations before excluding additional observations relating to agency transactions, and bonds that are not investment grade from the final sample.

## *A.2 Bond Characteristic Variables*

The following is a list of bond characteristic indicator variables that I use in the regressions as explanatory variables. I define each variable with information from the Mergent dataset.

- *AAA* - equal to 1 if the bond has an investment grade rating of AAA, 0 otherwise
- *OptCallSched* - equal to 1 if the bond has an optional call schedule, 0 otherwise
- *ExtraOrdCall* - equal to 1 if the bond issue is subject to an extraordinary call, 0 otherwise

- *PutOption* - equal to 1 if the bond has a put option, 0 otherwise
- *CredEnh* - equal to 1 if the bond has either additional credit or bond insurance, 0 otherwise
- *SinkFund* - equal to 1 if the bond has a sinking fund provision, 0 otherwise
- *OddIntFreq* - equal to 1 if the frequency of interest payments is not semi-annual, 0 otherwise
- *OddIntCalc* - equal to 1 if the interest calculation is not 30 days per month by 360 days per year, 0 otherwise
- *GenObl* - equal to 1 if the security is a general obligation bond, 0 otherwise
- *RevBond* - equal to 1 if the security is a revenue bond, 0 otherwise
- *GenPurp* - equal to 1 if the security is for general purpose or public improvement, 0 otherwise
- *Education* - equal to 1 if the use of proceeds relates to higher education, primary and secondary education, and other education; 0 otherwise
- *Utility* - equal to 1 if the use of proceeds relates to public utilities including power, gas telephone, water, and waste; 0 otherwise
- *Health* - equal to 1 if the use of proceeds relates to hospitals, nursing homes, and other healthcare; 0 otherwise
- *CertPart* - equal to 1 if the type of debt is a certificate of participation, 0 otherwise
- *FedTax* - equal to 1 if the maturity is taxable at the federal level, 0 otherwise
- *StateTax* - equal to 1 if the maturity is taxable by the state of issue, 0 otherwise

I also include an interaction term between *CredEnh* and  $I^{TR}$  ( $CredEnh \times I^{TR}$ ) to control for the potential change to the influence of credit enhancements on bond transactions as a result of the financial crisis.

### A.3 *Harris and Piwovar (2006) Methodology*

I follow Harris and Piwovar (2006) and model bond price  $P$  as a function of bond value  $V$ , investor transaction cost  $C$ , and interdealer price concession  $\delta$ . Transaction cost is dependent on whether the bond transaction is a dealer sale to a customer, a dealer purchase from a customer, or an interdealer transaction. To incorporate differences in transaction type, investor transaction cost is interacted with variable  $Q$ , equal to 1 if the transaction is a dealer sale to a customer, equal to -1 if the transaction is a dealer purchase from a customer, and equal to 0 if the transaction is an interdealer trade. Interdealer price concession  $\delta$  is interacted with an indicator variable  $I^D$ , equal to 1 if the trade is an interdealer trade, and equal to 0 otherwise. In equation form, the price for bond  $i$  at time  $t$  is

$$P_{it} = V_{it} + Q_{it}P_{it}C_{it} + I_{it}^D P_{it}\delta_{it}$$

After taking the natural log of both sides of the bond price equation, the price equation for bond  $i$  at time  $t$  is subtracted from the price equation for bond  $i$  at time  $s$ . Following the approximations made by Harris and Piwovar (2006), the equation for the difference in bond price from time  $s$  to time  $t$  is

$$r_{its}^P = r_{ts}^V + Q_{it}C_{it} - Q_{is}C_{is} + I_{it}^D\delta_{it} - I_{is}^D\delta_{is}$$

where  $r^P$  represents the difference in the natural log of bond price and  $r^V$  represents the difference in the natural log of bond value. I define time  $s$  using the most recent bond trade, either customer or interdealer, prior to the trade at time  $t$ . If more than one bond transaction occurs at time  $s$ , then I use the bond transaction with greatest par value to calculate returns for transactions that occur at time  $t$ . Large transactions, typically involving institutional investors, are likely to provide more information than small transactions, possibly involving

retail investors. If more than one transaction occurs at time  $t$ , then time  $s$  is equal to time  $t$ . In this instance, I use the transaction with the greatest par amount to calculate differences in the natural log of bond price.

Harris and Piwovar (2006) model the difference in the natural log of bond value between the two trades as

$$r_{its}^V = N_{ts}^{CalDay}(5\% - Coupon_i) + \beta_1^V AvgSL_{ts} + \beta_2^V DiffSL_{ts} + \gamma_{its}$$

where  $N_{ts}^{CalDay}$  represents the number of calendar days between time  $s$  and time  $t$ ,  $(5\% - Coupon)$  represents the difference between the bond's coupon interest rate and 5%,  $AvgSL$  represents the average in and  $DiffSL$  represents the difference between short-term and long-term index returns, and  $\gamma$  is model error. The difference between the bond's coupon rate and 5%, in units of one calendar day, measures the return a trader would expect between trade dates when interest rates are constant. The expression of all bond returns in this manner, including when calculating bond index returns, should not affect the results. The error term  $\gamma$  has mean zero and variance equal to  $N_{ts}^{TrdSes} \sigma_{TrdSes}^2$  where  $N_{ts}^{TrdSes}$  represents the number of trading sessions from time  $s$  to time  $t$ . I estimate index returns using a repeat sales regression methodology (Case and Shiller; 1987).<sup>30</sup>

Harris and Piwovar (2006) model transaction cost as a three or four term function. The primary cost function in their analysis is

$$C_i = c_0 + c_1 S_i^{-1} + c_2 \ln S_i + \kappa_i$$

where  $c_0$ ,  $c_1$ , and  $c_2$  represent model parameters;  $S$  represents transaction size; and  $\kappa$  represents model error. They motivate the equation as one part that controls for cost as a proportion of transaction size ( $c_0$ ), one part that controls for fixed costs per trade, ( $c_1 S^{-1}$ ), and one part that controls for cost as it varies with transaction size ( $c_2 \ln S$ ).

The bond price equation is modeled separately for each bond. The full bond price

---

<sup>30</sup>See Appendix A.4 for a full explanation of the repeat sales regression methodology.

equation is

$$r_{its}^P - N_{ts}^{CalDay}(5\% - Coupon_i) = \beta_1^V AvgSL_{ts} + \beta_2^V DiffSL_{ts} + Q_{it}C_{it} - Q_{is}C_{is} + \eta_{its} \quad (3)$$

where  $\eta$  represents model error. The error term  $\eta$  can be expressed as

$$\eta_{its} = \gamma_{its} + I_{it}^D \delta_{it} - I_{is}^D \delta_{is} + Q_{it} \kappa'_{it} - Q_{is} \kappa'_{is}$$

with zero mean and variance,  $\sigma_\eta^2$ , that can be expressed as

$$\sigma_\eta^2 = N^{TrdSes} \sigma_{TrdSes}^2 + D_{ts} \sigma_\delta^2 + (2 - D_{ts}) \sigma_\kappa^2$$

where  $D_{ts}$  is equal to the number of interdealer transactions between each of the two trades (0, 1 or 2),  $\sigma_\delta^2$  represents the variance of  $\delta$ , and  $\sigma_\kappa^2$  represents the variance of  $\kappa$ .

I follow Harris and Piwowar (2006) and use an iterated least squares methodology to estimate parameter estimates of equation (3) with weights equal to the inverse of  $\sigma_\eta^2$  estimates. Estimates of  $\sigma_\eta^2$  are obtained by pooling error terms from equation (3) and regressing the square of these error terms on  $N^{TrdSes}$ ,  $D_{ts}$ , and  $(2 - D_{ts})$ . The parameters multiplying  $N^{TrdSes}$ ,  $D_{ts}$ , and  $(2 - D_{ts})$  are constrained to be strictly greater than zero.

#### A.4 Repeat-Sale Regression

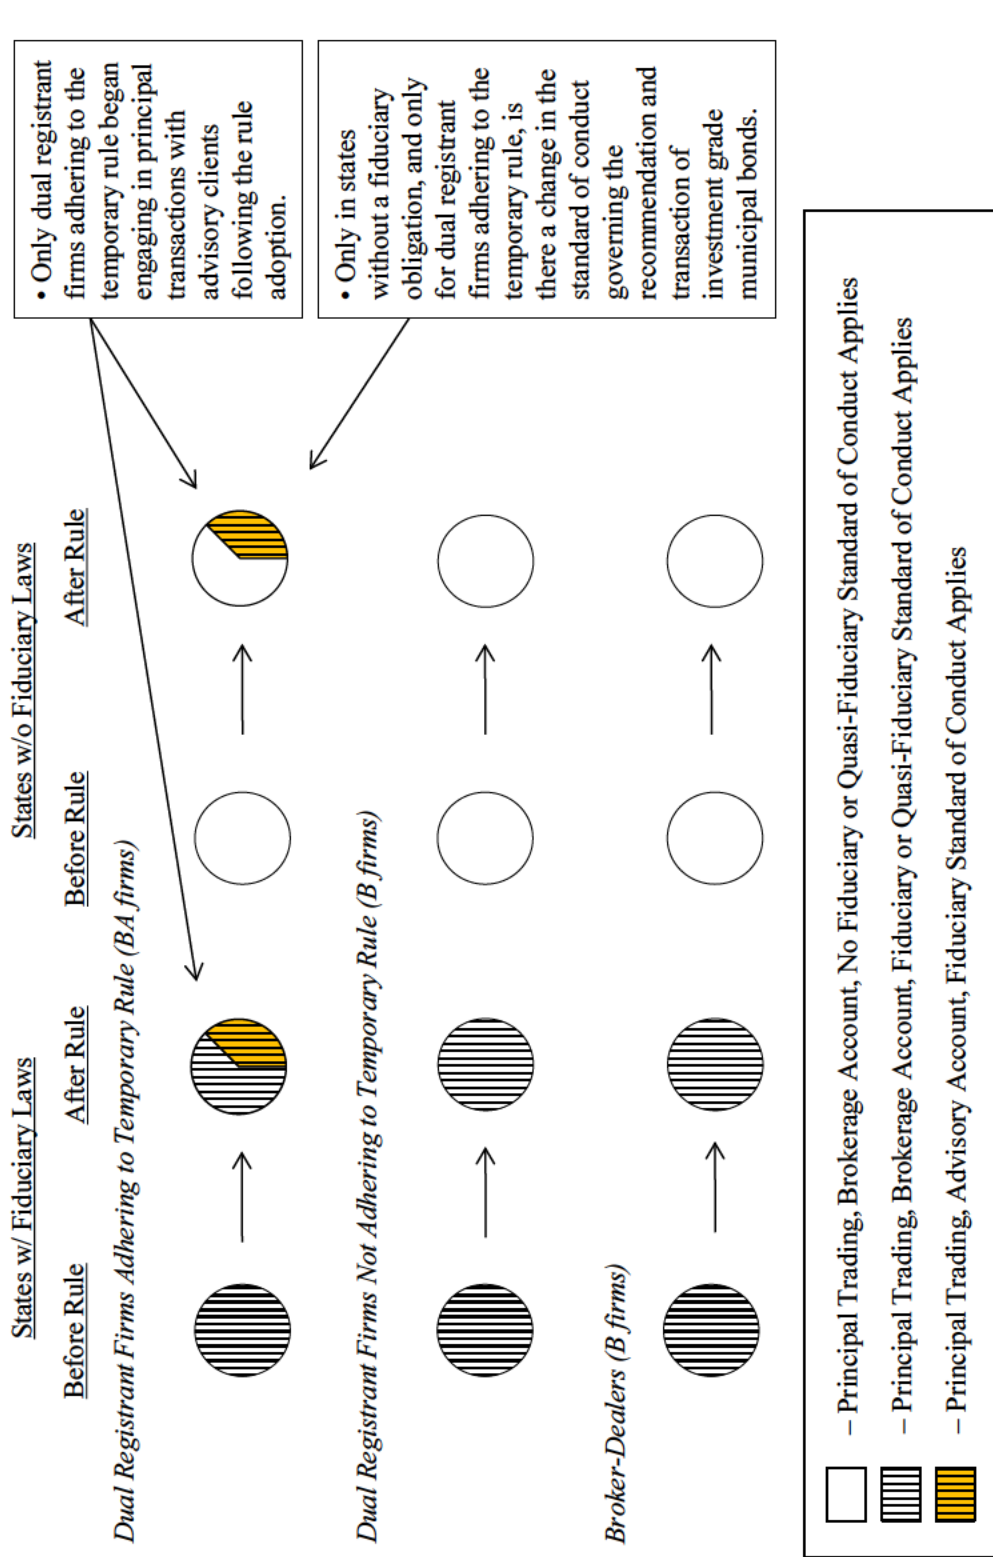

I calculate short-term and long-term bond daily index returns using the repeat-sale regression method of Case and Shiller (1987), regressing the returns of short-term bonds or long-term bonds on a set of indicator variables representing trade dates. I define bonds as short-term if less than 60 months remain until maturity, and bonds as long-term if at least 144 months remain until maturity. The indicator variables,  $I^{td}$ , are equal to 1 if the bond is held or sold on the trade date, 0 otherwise. The repeat-sale regression in equation form for all trades from the beginning of the sample period ( $\tau = 1$ ) to the end of the sample period ( $\tau = T$ ) is

$$r_{its} - N_{ts}^{CalDay}(5\% - Coupon_i) = \sum_{1 \leq \tau \leq T} \beta_\tau I_\tau^{td} + \zeta_{its} \quad (4)$$

where  $r_{its}$  represents the difference in the natural log of the price of bond  $i$  between time  $s$  and time  $t$ ,  $N_{ts}^{CalDay}$  represents the number of calendar days between time  $s$  and time  $t$ , and  $(5\%-Coupon)$  is the difference between the bond's coupon interest rate and 5% in units of one calendar day.

I obtain parameter estimates for both short-term and long-term bonds using a three-step procedure beginning with an initial estimate of equation (4). I then regress the initial squared estimates of  $\zeta$  on the total number of days between consecutive trades, the squared total number of days between trade dates, and an intercept. Lastly, I reestimate equation (4) using fitted values from the second stage as regression weights. I use interdealer transactions only in the repeat-sale regression to avoid noise from the bond prices of customer transactions. If more than one interdealer transaction occurs for the same bond on a given trade date, then I use the last interdealer transaction on that date.

**Figure 1: Changes to the Regulatory Regime Governing the Principal Transactions of Investment Grade Municipal Bonds by Firm and State Classification**

This figure describes the change in the regulatory regime governing principal transactions dependent on firm classification and the presence of state fiduciary laws. For simplicity, this figure does not account for changes to the proportion of advisory accounts held at dual registrant firms following the court decision and temporary rule adoption. See Section II for further discussion.

**Table 1: State Classification by Region**

| <b>Region</b> | <b>Non-Fiduciary States</b>                            | <b>N</b> | <b>Fiduciary States</b>                                                                                                                                       | <b>N</b> |

|               | States                                                 |          | States                                                                                                                                                        |          |
| Northeast     | Massachusetts, New York                                | 2        | Connecticut, Maine, New Hampshire, New Jersey, Pennsylvania, Rhode Island, Vermont                                                                            | 7        |
| Midwest       | Minnesota, North Dakota, Wisconsin                     | 3        | Illinois, Indiana, Iowa, Kansas, Michigan, Missouri, Nebraska, Ohio, South Dakota                                                                             | 9        |
| Southeast     | Arkansas, Mississippi, North Carolina                  | 3        | Alabama, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Oklahoma, South Carolina, Tennessee, Texas, Virginia, West Virginia | 14       |
| West          | Arizona, Colorado, Hawaii, Montana, Oregon, Washington | 6        | Alaska, California, Idaho, New Mexico, Nevada, Utah, Wyoming                                                                                                  | 7        |
| Number        |                                                        | 14       |                                                                                                                                                               | 37       |

This table lists the states either classifying as a fiduciary state or a non-fiduciary state by region. A fiduciary state requires broker-dealers to operate in a fiduciary or quasi-fiduciary capacity, whereas a non-fiduciary state makes no such requirements. See Sections II.b and III.c for a further description.

**Table 2: Number and Par Value of Customer Transactions**

| Year | All                                         |        | BA      |        | B       |        | All     |        | BA      |        | B       |       |
|------|---------------------------------------------|--------|---------|--------|---------|--------|---------|--------|---------|--------|---------|-------|

|      | <i>Panel C - All Customer Sales ≤ \$50k</i> |        |         |        |         |        |         |        |         |        |         |       |
| 2006 | 324,646                                     | 8.91   | 213,633 | 5.82   | 111,013 | 3.10   | 131,061 | 1.72   | 87,926  | 1.16   | 43,135  | 0.56  |
| 2007 | 332,124                                     | 9.29   | 222,049 | 6.19   | 110,075 | 3.10   | 129,266 | 1.72   | 87,542  | 1.18   | 41,724  | 0.54  |
| 2008 | 376,530                                     | 10.48  | 238,460 | 6.68   | 138,070 | 3.80   | 146,090 | 1.91   | 91,553  | 1.22   | 54,537  | 0.69  |

This table presents the aggregate number and value of all investment grade municipal bond customer principal transactions. Panel A presents information describing all customer sales and purchases, Panel B presents information describing all sales to customers, Panel C presents information describing all sales to customers less than or equal to \$50,000, and Panel D presents information describing all sales to customers less than or equal to \$20,000. The table presents customer transactions for all firms, for dual registrant firms engaging in principal transactions with brokerage and advisory clients after the temporary rule adoption (BA firms), and for firms engaging in principal transactions with brokerage clients only after the temporary rule adoption (B firms). I obtain transaction information from the MSRB RTRS dataset.

This table reports the results from tobit regressions describing the net par amount sold (*ParSale*) and the net number of municipal bond sales (*NumSale*) to retail investors. The regression model is equation (1). Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm sales, bond characteristics, and state level factors. In these tests, I define retail sales as customer sales with par value less than or equal to \$50,000. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section IV for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

This table reports estimates of the potential economic significance of a fiduciary standard of conduct. Columns with “ $E[Y]$ ” headers report the unconditional expected value of the dependent variables stemming from the estimation of regression equation (1) given the time period of the retail sales,  $I^{TR}$ , the classification of firms engaging in customer sales,  $I^{BA}$ , and the state classification relating to the bond,  $I^{NF}$ . All other variables are set to its sample mean. The variable  $Y$  represents either *ParSale* or *NumSale*. Columns with “ $\Delta_i$ ” headers report differences between time periods, and the third to last column reports the full difference between all firm and state classifications. I benchmark the full difference with the unconditional expected value of the dependent variables by BA firms in non-fiduciary states prior to temporary rule adoption. The last column relates the full difference to the benchmark. See Section IV for full explanation.

This table reports the abbreviated results from tobit regressions describing the net par amount sold (*ParSale*) and the net number of municipal bond sales (*NumSale*) to retail investors. The regression model is equation (1). I partition the full regression sample by calendar quarter. Q1 - Q4 refer to the first quarter to the fourth quarter following the temporary rule adoption. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm sales, bond characteristics, and state level factors. In these tests, I define retail sales as customer sales with par value less than or equal to \$50,000. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section IV for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

This table reports the results from tobit regressions describing the net par amount sold ( $ParSale$ ) and the net number of municipal bond sales ( $NumSale$ ) to institutional investors. The regression model is equation (1). Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm sales, bond characteristics, and state level factors. In these tests, I define institutional sales as customer sales with par value strictly greater than \$50,000. Standard errors are clustered at the 6-digit cusip level, and  $t$ -statistics are located to the right of parameter estimates in parentheses. See Section IV for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

This table reports the abbreviated results from tobit regressions describing the net par amount sold (*ParSale*) and the net number of municipal bond sales (*NumSale*) to institutional investors. The regression model is equation (1). I partition the full regression sample by calendar quarter. Q1 - Q4 refer to the first quarter to the fourth quarter following the temporary rule adoption. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm sales, bond characteristics, and state level factors. In these tests, I define institutional sales as customer sales with par value strictly greater than \$50,000. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section IV for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

This table reports the results from weighted regressions describing the cost of transactions of par value equal to \$20,000 and \$50,000. The regression model is equation (2). I weight observations with the inverse with transaction cost estimate variance. I follow the Harris and Piwovar (2006) methodology. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm transactions, bond characteristics, and state level factors. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section V for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

| N                                               | 14,046                      | 12,130                      | 16,697                      | 14,627                     |
| <i>adj. R</i> <sup>2</sup>                      | 0.22                        | 0.10                        | 0.11                        | 0.19                       |

This table reports the results from weighted regressions describing the cost of transactions of par value equal to \$100,000 and \$1,000,000. The regression model is equation (2). I partition the full regression sample by calendar quarter. Q1 - Q4 refer to the first quarter to the fourth quarter following the temporary rule adoption. I weight observations with the inverse with transaction cost estimate variance. I follow the Harris and Pivovar (2006) methodology. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm transactions, bond characteristics, and state level factors. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section V for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

Hello All,

On Thursday, October 17th, we will welcome Matthew Kozora, an economist at the Securities and Exchange Commission, to present his work on "The Effect of Regulatory Regimes on the Provision of Retail Investment Advice." The paper is available at SSRN ([http://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=2323519](http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2323519)), and I have attached a copy below. Matt's work has close ties to our conflicted advice project, and may have implications for the regulatory impact analysis. I hope others (not involved in the conflicted advice project) will be interested in this work as an example of how to examine the effects of rulemaking.

I do not anticipate having slides for the presentation; Matt will present from the paper.

# The Effect of Regulatory Regimes on the Provision of Retail Investment Advice<sup>\*,\*\*</sup>

Matthew L. Kozora

09/09/2013

Division of Economic and Risk Analysis

U.S. Securities and Exchange Commission

*Working Paper*

## Abstract

Broker-dealers and investment advisers are two separate types of financial intermediaries subject to different regulatory regimes that can provide personalized investment advice about securities to investors. In this paper, I investigate whether differences between the broker-dealer regulatory regime and the investment adviser regulatory regime may be significant to retail investment advice by examining the principal transactions of investment grade municipal bonds. The results in this paper indicate that the advice retail investors receive may be dependent on the legal framework governing its provision. In particular, I find evidence of a potential relationship between the standards under which broker-dealers and investment advisers provide advice and the sale of investment grade municipal bonds to retail investors.

*Keywords: Retail Investors, Broker-Dealers, Investment Advisers, Fiduciary Standard of Conduct, Municipal Bonds*

## I. Introduction

Investors can receive personalized investment advice about securities (or “personalized investment advice”) from two regulated types of financial intermediaries, broker-dealers and investment advisers, that may provide similar services but are subject to two different and

separate regulatory regimes. At the federal level, firms registered as broker-dealers are subject to the Securities Exchange Act of 1934 (or “Exchange Act”) and the rules thereunder, and the rules of self-regulatory organizations (or “SROs”), whereas firms registered as investment advisers are subject to the Investment Advisers Act of 1940 (or “Advisers Act”) and the rules thereunder. A firm registered as both a broker-dealer and an investment adviser (or “dual registrant firm”) may provide both brokerage and advisory services, and depending on whether the account is a brokerage account or an advisory account, be subject to the rules of either regulatory regime.<sup>1</sup>

Little to no research currently exists indicating whether differences between the broker-dealer and the investment adviser regulatory regimes can be significant to the advice retail investors receive in non-discretionary accounts.<sup>2</sup> In this paper, I investigate the effect of regulatory regimes by examining the principal transactions of investment grade municipal bonds.<sup>3</sup> I find evidence that suggests the regulatory regime, in particular the standards under which advice is given, may be significant to the advice retail investors receive.

I use investment grade municipal bonds in this study for two primary reasons. First, retail investors are major participants in the municipal bond market, individually investing in close to one-half of all municipal bonds outstanding.<sup>4</sup> The illiquidity and opacity of the municipal securities market (SEC; 2012a) also increases the importance of a financial agent

---

<sup>1</sup>A recent study by U.S. Securities and Exchange Commission (SEC) staff on investment advisers and broker-dealers as pursuant to Section 913 of the Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010 (or the “913 Study”) provides an in-depth review of the two regulatory regimes.

<sup>2</sup>The focus of this paper is the provision of personalized investment advice in non-discretionary accounts. A non-discretionary account does not provide a financial agent authority to transact securities without the consent of the account holder, whereas a discretionary account grants such authority. Recent estimates place the number of non-discretionary advisory accounts managed by federally registered investment advisers at 5 million, and the number of brokerage accounts at federally registered broker-dealers at 110 million. Both estimates include both institutional and retail accounts. Investment adviser information can be found at [www.sec.gov/foia/iareports/inva-archive.htm](http://www.sec.gov/foia/iareports/inva-archive.htm). The broker-dealer estimate includes both non-discretionary and discretionary accounts, and can be found in SEC (2011). I will refer to advisory clients with non-discretionary accounts as “advisory clients” or “clients,” brokerage customers with non-discretionary accounts as “brokerage customers” or “customers,” and brokerage customers and advisory clients generally as “investors.”

<sup>3</sup>A principal transaction is a transaction where the broker-dealer or investment adviser buys or sells securities for its own account.

<sup>4</sup>The estimate is as of the third quarter 2012, and can be found in the *Flow of Funds Accounts of the United States* statistical release, published by the Federal Reserve.

to provide advice to their customer or client.

Second, I use investment grade municipal bonds to incorporate a regulatory event into the empirical methodology. The regulatory event is the October 2007 adoption of a temporary SEC rule (or “temporary rule”). The temporary rule, among other things, established an alternative set of principal transaction disclosure and consent requirements under the Advisers Act for investment advisers also registered as broker-dealers. Prior to the temporary rule adoption, dual registrant firms typically did not engage in principal transactions with advisory clients, engaging in principal transactions with brokerage customers only.<sup>5</sup> Dual registrant firms adhering to the temporary rule (or “BA firms”) began engaging in principal transactions with both brokerage customers and advisory clients. Other firms, including all firms registered solely as broker-dealers and those dual registrant firms not adhering to the temporary rule (or “B firms”), continued to engage in principal transactions with brokerage customers only.<sup>6</sup> The temporary rule, still in effect at the time of this writing, does not permit a firm to rely on the rule for securities that it or an affiliated entity underwrites or issues except for non-convertible investment grade debt. I therefore use municipal bonds of investment grade only to be certain that the temporary rule can apply to all principal transactions in the empirical sample.<sup>7</sup>

The time period of the study is from January 2006 to December 2008. Broadly, I investigate whether regulatory regimes may be significant to the provision of personalized investment advice by comparing the change to the principal transactions of BA firms following the temporary rule adoption with the change to the principal transactions of B firms. If adherence to the temporary rule and the recommendation and transaction of investment

---

<sup>5</sup>In the initial temporary rule release, the SEC describes discussions with representatives of dual registrant firms regarding the difficulties of complying with the disclosure requirements under Section 206(3) of the Advisers Act (SEC; 2007). Firms explained that they typically did not engage in principal transactions with advisory clients as a result of the operationally restrictive disclosure requirements. The temporary rule has since been extended to December 31, 2014. See Section II.a for further explanation.

<sup>6</sup>I utilize municipal bond transaction data from the Municipal Securities Rulemaking Board (MSRB) Real-time Transaction Reporting System (RTRS). MSRB requires all broker-dealers and municipal securities dealers to report the transactions of municipal securities. Consequently, no firms in the sample are registered solely as investment advisers.

<sup>7</sup>See Section II.a for a further discussion of the temporary rule.

grade municipal bonds subject to the investment adviser regulatory regime is significant, then I may observe a difference in the change in principal transactions between BA firms and B firms as BA firms apply the temporary rule and the investment adviser regulatory regime to activities that would have otherwise been subject to only the broker-dealer regulatory regime.

As part of the empirical methodology, I specifically investigate whether the standard of conduct as required by federal and state law may be significant to the provision of personalized advice to retail investors.<sup>8</sup> At the federal level, an investment adviser is a fiduciary who is to serve in the best interests of its clients, including an obligation not to subordinate the clients' interests for their own and to disclose or eliminate all material conflicts of interest, whereas broker-dealers are required to deal fairly with their customers and in most instances are not considered a fiduciary. At the state level, broker-dealers may be subject to a fiduciary standard of conduct (SEC; 2011).<sup>9</sup>

I refine the broad comparison between BA firms and B firms to the state level, and compare the difference in the change in principal transactions between the two firm classifications between states where broker-dealers may be subject to additional standards of conduct that relate to a fiduciary standard of conduct (i.e., "fiduciary states") and states where broker-dealers are generally not subject to a fiduciary standard of conduct (i.e., "non-fiduciary states"). I assume, similar to the equity "home bias" (Coval and Moskowitz; 1999), that retail investors purchase the bonds of local or within-state municipalities.<sup>10</sup> By assumption, additional state standards of conduct would apply to the principal transactions of the municipal securities relating to the state.

Adherence to the temporary rule by BA firms in non-fiduciary states brought about the

---

<sup>8</sup>Other differences between the two regulatory regimes include disclosure requirements, supervisory and control procedures, continuing education requirements, and restrictions on advertising and other communications. The investment adviser regulatory regime is also largely principles-based and not predominately rules-based like the broker-dealer regulatory regime.

<sup>9</sup>See Section II.b for a further discussion of standards of conduct.

<sup>10</sup>Exemption from state and local taxes may also induce retail investors to purchase bonds of local or within-state municipalities (SEC; 2012a).

introduction of a fiduciary standard of conduct to the portion of investment grade municipal bond recommendations and transactions with advisory clients that would have otherwise been with brokerage customers, whereas adherence to the temporary rule by BA firms in fiduciary states did not result in a similar introduction of a fiduciary standard of conduct. Regardless of the presence of state fiduciary laws, the standard of conduct governing the recommendation and transaction of investment grade municipal bonds by B firms did not change following the temporary rule adoption as these firms continued to engage in principal transactions with brokerage customers only. Taken together, changes to the principal transactions of BA firms relative to B firms in fiduciary states may relate to the temporary rule and the investment adviser regulatory regime, but not a fiduciary standard of conduct, and changes to the principal transactions of BA firms relative to B firms in non-fiduciary states may relate to the temporary rule and the investment adviser regulatory regime including a fiduciary standard of conduct. An additional difference between BA firms and B firms in non-fiduciary states relative to fiduciary states, therefore, may relate to a fiduciary standard of conduct.

In the first set of tests, I investigate the effect of regulatory regimes on security recommendations by examining the sale of investment grade municipal bonds to retail investors. I do not find evidence indicating a difference in the change in sales to retail investors between BA firms and B firms following the temporary rule adoption in fiduciary states, but I do find evidence of additional sales to retail investors by BA firms relative to B firms in non-fiduciary states. Thus, I find evidence suggesting that a fiduciary standard of conduct may relate to the recommendation and sale of investment grade municipal bonds to retail investors, but no evidence that application of the temporary rule or other aspects of the investment adviser regulatory regime were also significant in explaining retail sales. In additional tests, I find that the relative increase in sales to retail investors by BA firms in non-fiduciary states was most significant soon after the temporary rule adoption. This result suggests that the increase in sales by BA firms in non-fiduciary states may relate more to the temporary rule

adoption and less to other factors which may also had an effect including events relating to the recent financial crisis.

In the second set of tests, I investigate the effect of regulatory regimes on the markup/markdown on, or the “transaction cost” (Harris and Piowar; 2006) of, investment grade municipal bonds. The implementation of policies and procedures to adhere to the temporary rule may have led to an increase in the compliance costs of BA firms. The increase in compliance costs may have resulted in higher transaction costs for retail investors who may have less access to pricing information than institutional investors (SEC; 2012a).<sup>11</sup> Research by Green, Hollifield, and Schürhoff (2007a) find evidence of differences in the level of informed trading between retail investors and institutional investors; transactions of smaller size, relating to retail investors, often exhibit less advantageous prices and a greater range of prices than the transactions of larger size, relating to institutional investors. I continue to distinguish bonds by state classification to investigate whether the additional increase in sales to retail investors by BA firms relative to B firms in non-fiduciary states was contemporaneous with an additional change in retail transaction cost.

I find evidence of an increase in transaction cost by BA firms relative to B firms following the temporary rule adoption in fiduciary states, but that the increase in transaction cost was not specific to retail transactions but also present in institutional transactions. Thus, I do not find evidence indicating that adherence to the temporary rule led specifically to additional retail investor transaction costs but instead find evidence of a more systematic change to the cost of all BA firm transactions. I also find evidence indicating an additional decrease in the cost of retail transactions by BA firms relative to B firms following the temporary rule adoption in non-fiduciary states. The time periods in which I find the additional decrease in transaction cost, however, only partially aligns with the time periods in which I find the additional increase in retail sales. Taken together, I do not find sufficient evidence in these

---

<sup>11</sup>See Section II.a for a further discussion of the requirements of the temporary rule. The markup/markdown bond traders set on firm inventory, especially for transactions that are more arm’s length, presumably would not be dependent on the account type of the investor and the regulatory regime under which the registered representative provides recommendations.

tests to conclude that changes to the regulatory regime stemming from the temporary rule adoption had an effect, either directly or indirectly, on the cost of retail transactions.

The results in this paper only provide suggestive evidence of the effects of regulatory regimes as a result of conducting tests at the firm level and not at the account level. Tests at the account level would require information describing the type of investor account, whether the transaction was solicited or unsolicited, and investor characteristics.<sup>12</sup> Other factors may be important in explaining the test results. I attempt to control for these other factors by comparing principal transactions between time periods, firms, and states, and controlling for differences between bonds, firms, and states with additional explanatory variables.

This is the first paper to empirically investigate the effect of regulatory regimes on the advice retail investors receive. The appropriate standard of conduct for broker-dealers and investment advisers is the subject of an ongoing debate among federal agencies, industry representatives, and investor advocacy groups. Some believe that a uniform fiduciary standard at the federal level applied across broker-dealers and investment advisers would provide additional retail investor protections, whereas others believe that a fiduciary standard of conduct applied to the broker-dealer regulatory regime would increase firm costs with little benefit and would ultimately result in reduced investor access to advice.<sup>13</sup> Examples of firm costs include ongoing costs relating to “back-office” functions, other compliance costs, and litigation costs.

Past research relating to the provision of financial advice typically investigates its net benefit or quality, and investigates only one type of financial agent or makes no distinction. Recent examples include Chalmers and Reuter (2011) who investigate the performance of

---

<sup>12</sup>The SEC recently requested data and other information relating to the benefits and costs of the standards of conduct and other obligations of broker-dealers and investment advisers (SEC; 2013). Examples of requested data and information include the types of services available to retail investors, the types of securities financial agents offer or recommend, and the costs to financial agents of providing personalized investment advice about securities.

<sup>13</sup>Comments to the 913 Study, including one by Oliver Wyman and the Securities Industry and Financial Markets Association, dated October 27, 2010, and one by State Farm VP Management Corporation, dated August 27, 2010, describe the potential costs of broker-dealers shifting to a fiduciary standard of conduct. All comment letters to the 913 Study and to a subsequent request for information and other data (SEC; 2013) can be found at <http://www.sec.gov/comments/4-606/4-606.shtml>.

brokerage customer retirement portfolios; and Mullainathan, Nöth, and Schoar (2011) who investigate the quality of investment advice provided by financial agents in an audit study.<sup>14</sup> These examples, as well as other research utilizing international data, indicate that retail investors do not always receive beneficial investment advice.<sup>15</sup> Other research finds conflicts of interest may partially determine the advice investors receive. For example, Bergstresser, Chalmers, and Tufano (2009) find that funds sold through an intermediary underperform funds sold directly to investors, and that the sale of underperforming funds may stem from conflicts of interest as a result of intermediary sales incentives.<sup>16</sup> I find that the advice investors receive may be partially determined by the regulatory regime governing its provision, and that investment advice should be evaluated in this respect.

Although the focus of this paper is on the provision of personalized investment advice, it also contributes to the municipal bond literature investigating municipal securities markets including Harris and Piwowar (2006); Green, Hollifield, and Schürhoff (2007a); Green, Hollifield, and Schürhoff (2007b); Green, Li, and Schürhoff (2010); Li and Schürhoff (2012); and Schultz (2012). I find evidence that the regulatory regime governing the provision of personalized investment advice may be an important determinant in the transaction of these securities, especially with respect to retail investors.

I organize the rest of the paper as follows: Section II provides additional regulatory background information, Section III describes the data, Section IV describes the tests of sales to retail investors, Section V describes the tests of transaction cost, and Section VI concludes.

---

<sup>14</sup>In relation to this paper, it is unclear whether Mullainathan et al. (2011) conduct audits of broker-dealers, investment advisers, or both. For instance, their use of the term “investment advisers” relates to “retail advisers whom the average citizen can access via their bank, independent brokerages, or investment advisory firms.” Thus, their definition of investment adviser seemingly incorporates both broker-dealers and investment advisers.

<sup>15</sup>Examples of research utilizing international data to investigate the quality of investment advice include Bhattacharya, Hackethal, Kaesler, Loos, and Meyer (2012); Fecht, Hackethal, and Karabulut (2010); Bluethgen, Meyer, and Hackethal (2008); Bluethgen, Gintschel, Hackethal, and Müller (2008); Karabulut (2011); Kramer (2009); and Kramer and Lensink (2009).

<sup>16</sup>Other work examining the distribution of mutual funds include Del Guercio and Reuter (2011); Del Guercio, Reuter, and Tkac (2010); and Christoffersen, Evans, and Musto (2013).

## II. Regulatory Background

This paper investigates the effect of regulatory regimes on the provision of personalized investment advice to retail investors. The null hypothesis is that the temporary rule and differences between the regulatory regimes do not matter to the principal transactions of investment grade municipal bonds relating to retail investors. The alternative hypothesis is that the temporary rule and differences between the regulatory regimes do matter to the principal transactions of investment grade municipal bonds relating to retail investors. Below, I provide additional background on the temporary rule, the investment adviser regulatory regime, and fiduciary standards of conduct. Figure 1 provides a diagram of the changes to the regulatory regime governing the principal transactions of investment grade municipal bonds by firm and state classification during the sample period.

### II.a *Changes to the Regulatory Regime Governing Principal Transactions*

The temporary rule establishes an alternative means for dual registrant firms to meet the requirements under Section 206(3) of the Advisers Act when engaging in principal transactions with non-discretionary advisory clients (SEC; 2007). The temporary rule, adopted in October 2007, was in direct response to a March 2007 court decision (*Financial Planning Association v. U.S. Securities and Exchange Commission*) overturning an SEC rule exempting broker-dealers from the definition of “investment adviser” when charging non-transaction based compensation (or “fee-based” brokerage accounts).<sup>17</sup>

Section 206(3) of the Advisers Act requires an investment adviser to provide written conflict-of-interest disclosure describing its role as principal when transacting securities from its own account and obtain client consent prior to transaction completion. The temporary rule provides a dual registrant firm the option of providing transaction-by-transaction disclosures verbally instead of in writing when engaging in principal transactions with non-

---

<sup>17</sup>Non-transaction based fees include fees based on the amount of assets under management. A consequence of the court decision was the requirement that dual registrant firms and broker-dealers treat fee-based brokerage accounts as advisory accounts, and that the firms as a result became subject to the restrictions of the Advisers Act when engaging in principal transactions. The temporary rule was adopted so that dually registered advisers could continue to engage in principal transactions with the customers of these accounts.

discretionary advisory clients as long as the firm satisfies additional requirements. Additional requirements of the temporary rule include the provision of a written prospective disclosure to clients describing the conflicts arising from principal transactions, acquisition of written revocable client consent prospectively authorizing such transactions, the provision of transaction-by-transaction confirmations, and the provision of annual reports itemizing the clients' principal transactions thereafter. The temporary rule does not relieve the obligations of the investment adviser regulatory regime including its fiduciary standard of conduct. Moreover, dual registrant firms engaging in principal transactions with advisory clients must also still adhere to the broker-dealer sales practice and best-execution obligations set by the SEC and SROs (SEC; 2007).

There are two primary changes to the regulatory regime governing the recommendation and transaction of investment grade municipal bonds stemming from adherence to the temporary rule which may have led to a change in sales to retail investors and retail transaction cost. The first primary change is the rules and requirements of the temporary rule itself. A dual registrant firm cannot rely on the rule for securities it or an affiliated entity underwrites or issues except for investment grade non-convertible debt. This restriction may have possibly resulted in a shift in sales from other securities to investment grade municipal bonds. Adherence to the temporary rule may have also led to an increase in compliance costs which may have been passed on to investors in the form of higher transaction costs. Compliance costs include the provision of written prospective disclosures, acquisition of written revocable client consent, and the implementation of systems to monitor adherence to the rule.

The second primary change is the application of the rules and requirements of the investment adviser regulatory regime, not including the rules and requirements of the temporary rule, to the recommendation and transaction of investment grade municipal bonds. The provision of personalized investment advice subject to the investment adviser regulatory regime, including a fiduciary standard of conduct, may have led to a change in security

recommendations retail investors receive and the cost of providing advice.<sup>18</sup>

Both primary changes may in some form have contributed to the results found below.<sup>19</sup> The results suggest that the introduction of a fiduciary standard of conduct to the recommendation and transaction of investment grade municipal bonds by BA firms in non-fiduciary states may have led to greater sales to retail investors.

## II.b *Standards of Conduct*

At the federal level, investment advisers are fiduciaries to their clients, whereas broker-dealers generally are not fiduciaries to their customers.<sup>20</sup> Both regulatory regimes provide protections to retail investors from abusive practices. Such protections include the obligation to seek best execution on customer or client orders, and the provision of investment advice which is suitable and in the best interests of their customers or clients. As part of a fiduciary duty, investment advisers also have an obligation to place the clients' interests in front of their own and to disclose or eliminate all material conflicts of interest.

In some states, broker-dealers are subject to a fiduciary standard of conduct (SEC; 2011). I assume that in practice standards of conduct, either directly or indirectly, are constraints to

---

<sup>18</sup>See footnote 13 and related text.

<sup>19</sup>Two other secondary changes may have also led to a change in security recommendations and transaction cost. The first of these secondary changes is the possible change in the number and the characteristics of investors with access to investment grade municipal bonds. As a result of the temporary rule, investment advisers at BA firms have greater ability to recommend certain securities from firm inventory to their advisory clients. If some advisory clients did not have access to these securities such as through additional brokerage accounts prior to the temporary rule adoption, then the adherence to the temporary rule may have changed the population of investors with access to these securities.

The second of these secondary changes is the change in the form of financial agent compensation for those customers transferring assets from fee-based brokerage accounts to commission-based brokerage accounts. Financial agents compensated with commissions may be more inclined to recommend securities not intended to be invested in long-term to collect transaction based fees. On the other hand, financial agents compensated with fees based on the amount of assets under management may be more inclined to recommend securities intended to be invested in long-term to avoid transaction costs.

Both the possible change in the population of investors with access to securities from firm inventory and the form of financial agent compensation would have effects that are more ongoing and that are independent of state fiduciary laws. The results, especially with respect to sales to retail investors, instead indicate that changes to the principal transactions of investment grade municipal bonds is dependent on state classification. It is possible, however, that these secondary changes also had an influence on the test results.

<sup>20</sup>There are differing interpretations as to when broker-dealers have a fiduciary obligation to their customers. The ambiguity stems from a lack of litigated cases impeding the development of case law, variation in customer contracts, and inconsistencies between states (Laby; 2010).

the investment advice financial agents provide. Although firms may not implement control and compliance systems or procedures to address differences in state law, state law may still be important to the provision of personalized investment advice. For instance, in case of customer dispute, federal courts would look to state law to determine the fiduciary obligations of a broker-dealer (Laby; 2010), and arbitrators can apply state laws to determine awards in case of customer arbitration.<sup>21</sup>

### III. Data Description

I obtain information describing the business of dual registrant firms and broker-dealers from public SEC filings, municipal bond characteristics from the Mergent Municipal Bond Securities Database (Mergent dataset) and SDC Platinum, municipal bond transaction data from the MSRB RTRS dataset, and state information from various sources.

The time period of study is from January 2006 to December 2008. I use bonds with offering dates between January 2006 and December 2006, and between October 2007 and September 2008. I choose a short time period to accurately test the change in municipal bond transactions while avoiding to the fullest extent possible the impact of the global financial crisis of 2008. I do not include municipal bonds with offering dates within 60 trading days of the court decision, from January 2007 to March 2007, and between the court decision and the temporary rule adoption, from March 2007 to September 2007, due to the legal uncertainty of the time period. Similar to Green et al. (2007a), my sample includes only bond transactions occurring within 60 trading days of the bond offering date. The 60 trading day window allows me to incorporate the municipal bonds that are the most frequently traded and to limit the number of municipal bonds with trading periods that overlap either the court decision or the temporary rule adoption.

---

<sup>21</sup>Customers of broker-dealers and dual registrant firms, including the advisory clients at dual registrant firms, typically sign pre-dispute arbitration agreements with their financial agent. Training materials from the Financial Industry Regulatory Authority (FINRA), which operates the largest dispute resolution program in the securities industry, guides arbitrators to seek guidance in most cases from the parties involved to determine the applicable law or laws. See *The Neutral Corner*, Volume 3 (2010), published by FINRA, and *Basic Arbitrator Training*, also published by FINRA, for training materials.

### III.a *Broker-Dealer and Dual Registrant Firm Information*

The initial sample of broker-dealers (and dual registrant firms) includes all broker-dealers that engaged in a municipal bond transaction during the sample period and that is reported in the MSRB RTRS dataset. I require all firms to file annual SEC Form X-17A-5 audited reports with information encompassing the sample period to ensure that the sample of broker-dealers does not change from before the court decision to after the temporary rule adoption. Form X-17A-5 is a financial and operational report that must be filed by all broker-dealers registered with the SEC, and can be found on the SEC's EDGAR system. I obtain information describing the firm's investment adviser business, if any, from annual SEC Form ADV filings. Investment advisers and dual registrant firms file Form ADV with the SEC to provide general information including the types of clients, compensation arrangements, and advisory activities. Past Form ADV filings can be found on the SEC's Investment Adviser Public Disclosure website.

I classify a firm as a BA firm if it files Form ADV, reports actively engaging in business as a broker-dealer, reports a positive number of non-discretionary advisory accounts, and reports that it engages in principal transactions with advisory clients. BA firms are only potentially adhering to the temporary rule because firms filing Form ADV do not specifically acknowledge adherence to the rule. A B firm either does not file Form ADV, does not report actively engaging in business as a broker-dealer, does not report a positive number of non-discretionary clients, or does not report that it engages in principal transactions with advisory clients. B firms, therefore, could not be relying on the temporary rule. Because firms generally did not engage in principal transactions with non-discretionary advisory clients prior to the temporary rule adoption, I classify firms using information from the time period following the rule adoption only. To obtain a more direct comparison between firms either adhering to the temporary rule or not adhering to the rule, I exclude firms that are not solely classified as either a BA firm or a B firm as of December 2007 and December 2008. There are 95 BA firms and 1,475 B firms that meet all sample requirements.

### III.b *Municipal Bond Characteristics*

I obtain bond characteristic information from the Mergent dataset. The Mergent dataset provides security and issue information for 484,256 individual bonds with offering dates between July 2005 and December 2008. I extract bond information from the Mergent dataset including the type and frequency of coupon payments, put options, call options, sinking fund provisions, non-standard interest frequency or interest calculation, credit enhancements, tax status, the type of debt-paying assets, and the use of proceeds. I obtain bond ratings information from SDC Platinum.

I exclude 26,075 individual bonds from the initial sample with missing offering price information, missing or inaccurate total offering amount information, remarketed bonds, and bonds not relating to any of the 50 states or the District of Columbia.<sup>22</sup> To incorporate the Harris and Piwovar (2006) bond model in my analysis, I exclude 16,586 individual bonds with a derivative or warrant feature, and 8,346 individual bonds with non-standard coupon payments (adjustable, floating, flexible, variable, inverse, or index-linked coupons). I also exclude 80,986 individual bonds that are either designated as non-investment grade or with missing ratings information in SDC Platinum to ensure that the temporary rule can apply to all bonds in the sample. There are 352,309 bonds remaining in the sample. Bond issuances are spread evenly throughout the sample period. There are 109,168 investment grade municipal bonds meeting sample requirements with offering dates between January 2006 and December 2006, and there are 89,543 investment grade municipal bonds meeting sample requirements with offering dates between October 2007 and September 2008.

### III.c *State Information*

I obtain state law information from Finke and Langdon (2012) who classify states and the District of Columbia into one of three categories based on whether broker-dealers are subject to a fiduciary standard of conduct, a quasi-fiduciary standard of conduct, or no

---

<sup>22</sup>I search for inaccurate total offering amount information by examining individual bonds with total offering amount less than denomination amount. Often these securities are zero-coupon bonds selling at a discount. However, it can also be indicative of data error. I find only a few such examples.

fiduciary standard of conduct. They base their classification scheme on court decisions and state regulations. It is unclear the extent to which state level fiduciary or quasi-fiduciary standards of conduct relate to the fiduciary standard of conduct of the investment adviser regulatory regime. For instance, Finke and Langdon (2012) note that some quasi-fiduciary states “impose a standard higher than the suitability standard imposed by FINRA for non-discretionary accounts.”

From the classification of Finke and Langdon (2012), I define a fiduciary state as a state where broker-dealers are subject to a fiduciary or quasi-fiduciary standard of conduct, and a non-fiduciary state as a state where generally broker-dealers are not subject to a fiduciary standard of conduct. State classifications relate to the standards of conduct governing the provision of advice in non-discretionary accounts. The difference between states is whether broker-dealers are either subject to additional standards of conduct that seemingly relate to a fiduciary standard or are generally not subject to a fiduciary standard of conduct. Table 1 presents a listing of fiduciary states and non-fiduciary states by geographic region. There are 37 fiduciary states and 14 non-fiduciary states. A little more than a quarter of bond issues relate to non-fiduciary states.

I obtain state income information from the U.S. Census Bureau, gross state product statistics from the Bureau of Economic Statistics, and tax information from the Federation of Tax Administrators. I incorporate the information in the regressions below to control for state level economic differences.

#### III.d *Municipal Bond Transaction Data*

I obtain municipal bond transaction data from the MSRB RTRS dataset. The dataset contains information for all municipal bond transactions from July 2005 to March 2009. Each observation provides information regarding bond cusip, trade date, time of trade, settlement date, bond price, par value, and transaction commissions. The dataset also contains fields identifying the transacting broker or brokers, the type of transaction (between two dealers or a dealer and a customer, sale or purchase), and dealer capacity (principal or agent). The

dataset does not contain information describing the type of investor engaging in customer transactions (institutional or retail), the type of customer account (brokerage or advisory), and whether the transaction was solicited or unsolicited. There are 5,382,087 observations relating to the principal transactions of sample investment grade municipal bonds in the final sample. In Appendix A.1, I describe measures to clean the dataset for missing or inaccurate trade dates, inaccurate prices, managed account transactions, and other possible data errors.

Table 2 presents the amount of investment grade municipal bond customer principal transactions relating to firms in the final sample. The table includes four panels presenting the total number and value of all customer transactions (Panel A), the total number and value of all sales to customers (Panel B), the total number and value of all sales to customers less than or equal to \$50,000 (Panel C), and the total number and value of all sales to customers less than or equal to \$20,000 (Panel D). I use sales to customers less than or equal to \$50,000 and less than or equal to \$20,000 to proxy for sales to retail investors. In each panel the table also presents transaction information by firm classification. In no year did B firms engage in more customer transactions or sales to customers than BA firms. Considering the number of BA firms to B firms, the comparison in customer transactions and sales highlights the difference in trading activity between the two classifications of firms.

## IV. Tests of Municipal Bond Sales

### IV.a *Empirical Model*

In the first set of tests, I investigate the effect of regulatory regimes on security recommendations by examining the sale of investment grade municipal bonds to retail investors. I define a transaction as a “retail transaction” if the par amount is less than or equal to \$50,000. Alternatively, I define a transaction as a retail transaction if the par amount is less than or equal to \$20,000. Evidence by Green et al. (2007a) indicates that sales to customers of smaller par amount exhibit greater average markups and intraday price dispersion than sales to customers of larger par amount. The greater price dispersion among smaller trans-

actions is akin to a set of investors, such as retail investors, with varying access to pricing information.

I estimate regressions at the individual bond level, measuring the sale of investment grade municipal bonds to retail investors with *ParSale*, equal to the net par sold to retail investors, and *NumSale*, equal to the net number of sales to retail investors. I include two sets of explanatory variables in the regression. Similar to the difference-in-difference-in-differences empirical methodology, the first set of explanatory variables controls for the time period of the bond offering date (either before the court decision or after the temporary rule adoption), the classifications of firms engaging in customer sales (either BA or B), and the state classification relating to the bond (either non-fiduciary or fiduciary). The variables include

- $I^{TR}$  - an indicator variable equal to 1 if the offering date of the bond is after the temporary rule adoption, and 0 if the offering date of the bond is before the court decision
- $\overline{I^{BA}}$  - a continuous variable with a range between 0 and 1 equal to the average of  $I^{BA}$  (an indicator variable equal to 1 if a BA firm engages in the bond sale, and 0 if a B firm engages in the bond sale) for all firms engaging in at least one customer sale regardless of par amount<sup>23</sup>
- $I^{NF}$  - an indicator variable equal to 1 if the bond relates to a non-fiduciary state, and 0 if the bond relates to a fiduciary state
- interaction terms between  $I^{TR}$ ,  $\overline{I^{BA}}$ , and  $I^{NF}$  -  $I^{TR} \times \overline{I^{BA}}$ ,  $I^{TR} \times I^{NF}$ ,  $\overline{I^{BA}} \times I^{NF}$ , and  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$

---

<sup>23</sup>I weight the average with the total par amount of firm customer sales. I average  $I^{BA}$  using all firms engaging in at least one customer sale regardless of transaction size instead of firms engaging in at least one retail sale to measure the classifications of firms that could have engaged in a retail sale.  $\overline{I^{BA}}$  is undefined for bonds with no customer sales. These bonds are therefore not in the regression sample.

The second set of explanatory variables controls for differences between firms, bonds, and states that could also be important in explaining retail sales. The potential amount of bond sales to retail investors should relate to the trading activity of the firms engaging in customer sales. I control for firm trading activity with a quarterly measure of net firm customer sales ( $CSales$ ) averaged at the bond level similar to  $\overline{I^{BA}}$  ( $\overline{CSales}$ ). I also control for differences between bonds by including variables describing the total par offering amount ( $TotPar$ ), bond maturity ( $Maturity$ ), and other bond characteristics (see Appendix A.2).

Assuming that retail investors purchase the bonds of within-state municipalities, economic differences between states could also be important in explaining retail sales. I control for differences in income distributions with annual median income ( $StateMedInc$ ) and annual income standard error ( $StateIncSE$ ). I also control for differences in investor demand ( $StateDmnd$ ) equal to the natural log of the product of state GDP and the maximum of personal, corporate, and bank state tax rates (Harris and Piwowar; 2006). Lastly I include aggregate state level total par offering amount ( $StateTotPar$ ) to control for recent bond issuance activity.

I rescale  $ParSale$ ,  $\overline{CSales}$ ,  $TotPar$ ,  $StateMedInc$ ,  $StateIncSE$ , and  $StateTotPar$ , by dividing each variable by 10,000 and then taking the natural log of one plus the scaled value. I also rescale  $NumSale$  and  $Maturity$  by taking the natural log of one plus its value. I lag  $\overline{CSales}$ ,  $TotPar$ ,  $StateTotPar$ ,  $StateMedInc$ ,  $StateIncSE$ , and  $StateDmnd$  to the quarter or year prior to the bond offering date. In equation form, I estimate the following regression

$$\begin{aligned}
Y_i = & \beta_0 + \beta_1 I_i^{TR} + \beta_2 \overline{I_i^{BA}} + \beta_3 \left( I_i^{TR} \times \overline{I_i^{BA}} \right) \\
& + \beta_4 I_i^{NF} + \beta_5 \left( I_i^{TR} \times I_i^{NF} \right) + \beta_6 \left( \overline{I_i^{BA}} \times I_i^{NF} \right) \\
& + \beta_7 \left( I_i^{TR} \times \overline{I_i^{BA}} \times I_i^{NF} \right) + \boldsymbol{\beta} \mathbf{X}_i + \varepsilon_i
\end{aligned} \tag{1}$$

where  $Y$  represents either  $ParSale$  or  $NumSale$ ,  $\beta$  represents model parameters,  $\mathbf{X}$  represents

the set of additional control variables,  $\varepsilon$  represents model error, and  $i$  indexes bonds.<sup>24</sup> I estimate both regressions using a tobit model that specifies censored observations at 0. I exclude individual bond observations with net par sold or net number of sales less than 0. With these observations, I am likely either missing transactions as a result of excluding firms not meeting sample requirements or miscategorizing transactions as relating to either retail or institutional customers.<sup>25</sup> I calculate  $t$ -statistics with standard errors clustered at the 6-digit cusip level to account for correlations in the error term at the level of the municipality. There are 157,116 observations relating to individual bonds in the regressions describing net sales less than or equal to \$50,000, and there are 157,979 observations relating to individual bonds in the regressions describing net sales less than or equal to \$20,000.

Two of the explanatory variables are of particular interest. The first variable of interest,  $I^{TR} \times \overline{I^{BA}}$ , controls for the change in retail sales following the temporary rule adoption in fiduciary states (setting  $I^{NF}$  equal to 0) dependent on the classification of firms engaging in bond customer sales. A significant regression parameter estimate corresponding to this variable indicates that the retail sale of a bond following the temporary rule adoption is dependent on the classifications of firms engaging in customer sales, and suggests that the temporary rule or the investment adviser regulatory regime, but not a fiduciary standard of conduct, may influence security recommendations.

The second variable of interest,  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$ , controls for the additional change in retail sales following the temporary rule adoption in non-fiduciary states (setting  $I^{NF}$  equal to 1) dependent on the classification of firms engaging in customer sales. A significant regression parameter estimate corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  indicates that there is an additional effect following the temporary rule adoption in the relationship between retail sales and the classifications of firms engaging in customer sales in non-fiduciary states, and

---

<sup>24</sup>I also include state fixed effects in an alternative regression specification. I find little difference in the results.

<sup>25</sup>I exclude 3,444 observations with either negative net retail or institutional sales (see Section IV.c) when the retail transaction threshold is set at \$50,000, and I exclude 2,473 observations with either negative net retail or institutional sales when the retail transaction threshold is set at \$20,000.

suggests that a fiduciary standard of conduct may influence security recommendations.

#### IV.b *Results*

Table 3a presents model estimates for regression equation (1) when the retail transaction threshold is set at \$50,000, and Table 3b presents model estimates for regression equation (1) when the retail transaction threshold is set at \$20,000. I find that the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}}$  are insignificant in all regressions, whereas the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  are positive and significant at the 95% confidence level in all regressions. The sign and significance of the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  indicate an additional increase in retail sales by BA firms relative to B firms in non-fiduciary states following the temporary rule adoption, and suggests that a fiduciary standard of conduct may relate to the retail sale of investment grade municipal bonds. The insignificance of the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}}$  indicate that I do not find evidence in this empirical setting that the temporary rule or other aspects of the investment adviser regulatory regime may also explain retail sales following the rule adoption.

Among the other control variables, I find that average firm customer sales, bond total par offering amount, and bond maturity are positive and significant determinants of retail sales, whereas other bond characteristics including sinking fund provisions, odd interest payment frequency, and federal and state taxes are negative and significant. In general, the sign and significance of the bond characteristic variables reflects the inclination of financial agents to avoid recommending and selling municipal bonds to retail investors with disadvantageous or complex features. I also find that state median income and investor demand are also positive and significant determinants of retail sales.

I estimate the possible economic significance of a fiduciary standard of conduct by subtracting the change in the unconditional expected value of *ParSale* and *NumSale* for a bond sold entirely by BA firms in non-fiduciary states with (a) the same change for a bond sold entirely by B firms in non-fiduciary states, and with (b) the same change for a bond sold

entirely by BA firms in fiduciary states. I calculate the unconditional expected amount of retail sales for a bond sold either entirely by BA firms or by B firms to obtain the most direct comparison between firm and state classifications as possible. In equation form, I estimate

$$\underbrace{(E[Y_{1,1,1}] - E[Y_{0,1,1}])}_{\Delta \text{ BA/non-fiduciary}} - \underbrace{(E[Y_{1,0,1}] - E[Y_{0,0,1}])}_{\Delta \text{ B/non-fiduciary}} - \underbrace{(E[Y_{1,1,0}] - E[Y_{0,1,0}])}_{\Delta \text{ BA/fiduciary}}$$

where  $Y$  represents either *ParSale* or *NumSale*, the first subindex of  $Y$  represents the value of  $I^{TR}$ , the second subindex of  $Y$  represents the value of  $\overline{I^{BA}}$ , and the third subindex of  $Y$  represents the value of  $I^{NF}$ . The first comparison, retail sales relating to B firms in non-fiduciary states, accounts for the change in expected retail sales in non-fiduciary states, and the second comparison, retail sales relating to BA firms in fiduciary states, accounts for the change in expected retail sales by BA firms. Neither comparison accounts for the change in bond sales as a result of an introduction of a fiduciary standard of conduct, such as with BA firms in non-fiduciary states, to a portion of security recommendations that would otherwise have not been subject to such a standard. The full difference, therefore, measures the potential effect of a fiduciary standard of conduct to the recommendation and sale of investment grade municipal bonds. To obtain a relative measure, I benchmark the full difference to the unconditional expected value of the dependent variables for a bond sold entirely by BA firms in non-fiduciary states prior to the court decision ( $E[Y_{0,1,1}]$ ).

Table 4 presents the estimates of economic significance. When the retail transaction threshold is set at \$50,000, I find that a fiduciary standard of conduct may lead to an 8.3% increase in *ParSale* and a 9.2% increase in *NumSale* per bond, and when the retail transaction threshold is set at \$20,000, I find that a fiduciary standard of conduct may lead to a 16.4% increase in *ParSale* and a 16.0% increase in *NumSale* per bond. The influence of a fiduciary standard of conduct on security recommendations does not necessarily imply that the recommendations are necessarily “better,” but does imply that the recommendations are different. For example, there is a trade-off between having securities in brokerage accounts

where generally the financial agent has no continuing obligation after providing investment advice but also does not charge ongoing fees, and having securities in advisory accounts where more typically the financial agent has agreed to a continuing obligation after providing investment advice but charges fees based on assets under management.<sup>26</sup> The decision to have long term assets in advisory accounts instead of brokerage accounts may therefore prove to be more costly in the long run.

#### *IV.c Extensions*

The time period of the study overlaps events relating to the recent financial crisis which may also have had an effect on the recommendation and sale of investment grade municipal bonds. For instance, bonds with offering dates from July 2008 to September 2008 have 60 trading day windows that overlap the bankruptcy of Lehman Brothers in September 2008. To investigate whether other events may have also led to a change in retail sales following the temporary rule adoption, I partition the full regression sample into calendar quarters and reestimate regression equation (1). That is, I reestimate regression equation (1) using bonds with offering dates either in the fourth quarter of 2006 and in the fourth quarter of 2007 (the first quarter following the temporary rule adoption), in the first quarter of 2006 and in the first quarter of 2008, in the second quarter of 2006 and in the second quarter of 2008, or in the third quarter of 2006 and the third quarter of 2008 (the fourth quarter following the temporary rule adoption). I partition the regression sample by calendar quarter to control for the effect of seasonal trends. If the results in the first set of tests relate to the adoption of the temporary rule, then I should find similar evidence either soon after the temporary rule adoption or throughout the post-event time period.

Table 5a presents the abbreviated regression results when the retail transaction threshold is set at \$50,000, and Table 5b presents the abbreviated regression results when the retail

---

<sup>26</sup>Whether a broker-dealer or investment adviser has continuing obligations is dependent on the contractual arrangement with the customer. Over 95% of investment advisers charge fees based on the percentage of assets under management and less than 10% of investment advisers charge transaction based compensation (SEC; 2011).

transaction threshold is set at \$20,000. I find that the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  are positive and statistically significant in the regressions describing the retail sale of bonds with offering dates in the first quarter and in the second quarter following the temporary rule adoption, and are insignificant in the regressions describing the retail sale of bonds with offering dates in the third quarter and in the fourth quarter. These results indicate that if a fiduciary standard of conduct was significant in resulting in additional investment grade municipal bond retail sales, then it was most significant shortly after the rule adoption and before the potential influence of other events. I also only find strong evidence that  $I^{TR} \times \overline{I^{BA}}$  is statistically significant in the regressions describing retail sales of bonds with offering dates in the second quarter. Thus, I do not find evidence of a trend that could relate to the temporary rule or other aspects of the investment adviser regulatory regime.

As a comparison to retail sales, I reestimate regression equation (1) but instead model institutional sales. I define a customer transaction as an “institutional transaction” if the par amount is strictly greater than \$50,000. The additional increase in retail sales by BA firms relative to B firms in non-fiduciary states following the temporary rule adoption could be the result of a relative overall increase in the sale of these securities by BA firms and may not pertain specifically to retail investors. I reestimate regression equation (1) using the full regression sample and the regression sample partitioned by calendar quarter.

Table 6 presents the regression results when I use the full regression sample. I find that the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}}$  are positive and statistically significant in both regressions, and that only in the regression describing *ParSale* is the parameter estimate corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  statistically significant albeit negative. These results suggest that although there was an increase in institutional sales by BA firms relative to B firms following the temporary rule adoption, the change in institutional sales dependent on the classification of firms engaging in customer sales was more positive for bonds relating to fiduciary states than to non-fiduciary states. Although a relationship potentially exists

between retail and institutional sales, these results suggest that the relative increase in retail sales by BA firms in non-fiduciary states is not reflective of an overall trend relating to these firms and securities. Table 7 presents the abbreviated regression results when I separate bond observations by calendar quarter. Similar to the quarterly regressions describing retail sales, and further evidence of a potential relationship between retail and institutional sales, I find that parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}}$  and  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  are significant in the regressions describing the institutional sale of bonds with offering dates in the first quarter and in the second quarter following the temporary rule adoption, and insignificant in the regressions describing the institutional sale of bonds with offering dates in the third quarter and in the fourth quarter.

## V. Tests of Retail Transaction Cost

### V.a *Empirical Model*

In the second set of tests, I investigate the effect of regulatory regimes on the transaction cost of investment grade municipal bonds. I utilize the Harris and Piwowar (2006) methodology to measure transaction cost.<sup>27</sup> The model describes bond price as a function of bond value, transaction cost, and interdealer price concession. The authors model transaction cost as a three term function. From this cost function, I obtain estimates of transaction cost at the individual bond level for transactions of par value equal to \$20,000, \$50,000, \$100,000, and \$1,000,000. Cost estimates of transactions of par value equal to \$20,000 and \$50,000 relate more to the cost of retail transactions, and cost estimates of transactions of par value equal to \$100,000 and \$1,000,000 relate more to the cost of institutional transactions.

To investigate the effect of regulatory regimes on transaction cost, I regress estimates of transaction cost on variables controlling for firm classification, the time period of the bond offering, the state classification relating to the bond, and other potential determinants of transaction cost including bond characteristics and state level variables. The additional variables in the cost function are similar to the explanatory variables that I use to explain

---

<sup>27</sup>See Appendix A.3 for a description of the methodology.

customer sales in Section IV. However, I respecify  $\overline{I^{BA}}$  and  $\overline{CSales}$  to take into consideration the utilization of each customer transaction to estimate transaction cost. I now define the variable  $\overline{I^{BA}}$  as the non-weighted average of  $I^{BA}$  of all customer transactions, both purchases and sales, and  $\overline{CSales}$  as the non-weighted average of the aggregate par amount of all firm customer transactions ( $\overline{CTrans}$ ). I estimate the following regression

$$\begin{aligned} \widehat{C}_{S,i} = & \beta_0 + \beta_1 I_i^{TR} + \beta_2 \overline{I_i^{BA}} + \beta_3 \left( I_i^{TR} \times \overline{I_i^{BA}} \right) \\ & + \beta_4 I_i^{NF} + \beta_5 \left( I_i^{TR} \times I_i^{NF} \right) + \beta_6 \left( \overline{I_i^{BA}} \times I_i^{NF} \right) \\ & + \beta_7 \left( I_i^{TR} \times \overline{I_i^{BA}} \times I_i^{NF} \right) + \beta \mathbf{X}_i + \varepsilon_i \end{aligned} \quad (2)$$

where  $\widehat{C}$  represents cost estimates and  $S$  represents transaction size.<sup>28</sup> I incorporate the Bayesian shrinkage estimator of Harris and Piwovar (2006) to calculate the variance of cost estimates, and weight regression observations with the inverse of the variances. I calculate  $t$ -statistics with standard errors clustered at the 6-digit cusip level to account for correlations in the error term at the level of the municipality. There are 57,540 individual bonds that meet the requirements of the Harris and Piwovar (2006) model, and 57,500 observations relating to individual bonds that are in the regression sample.

Similar to the regressions in Section IV, the two variables of interest are  $I^{TR} \times \overline{I^{BA}}$  and  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$ . A significant regression parameter estimate corresponding to  $I^{TR} \times \overline{I^{BA}}$  indicates a change in transaction cost following the temporary rule adoption in fiduciary states dependent on the classification of firms engaging in bond customer transactions. Significance of this variable suggests, especially for estimates of retail transaction cost, that the costs relating to compliance of the temporary rule may have resulted in an increase in the cost of BA firm transactions. A significant regression parameter corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  indicates an additional change in transaction cost in non-fiduciary states following the temporary rule adoption dependent on the classification of firms engaging in

---

<sup>28</sup>I also include state fixed effects in an alternative regression specification. I find little difference in the results.

bond customer transactions. The results in the first set of tests indicate an additional increase in retail sales by BA firms relative to B firms in non-fiduciary states. It is possible that this additional increase in retail sales is also contemporaneous with a change in retail transaction cost.

## V.b *Results*

Similar to Harris and Piwowar (2006), I find that customer transaction cost decreases as transaction size increases. For example, average transaction cost weighted by the inverse of cost estimate variance ranges from 87 basis points for transactions of \$20,000, to 77 basis points for transactions of \$50,000, to 63 basis points for transactions of \$100,000, and to 21 basis points for transactions of \$1,000,000. These estimates are similar to Harris and Piwowar (2006) who find that average customer transaction cost ranges from 99 basis points for transactions of \$20,000, to 77 basis points for transactions of \$50,000, to 62 basis points for transactions of \$100,000, and to 24 basis points for transactions of \$1,000,000.

Table 8a presents model estimates for regression equation (2) describing the cost of transactions of par value equal to \$20,000 and \$50,000, and Table 8b presents model estimates for regression equation (2) describing the cost of transactions of par value equal to \$100,000 and \$1,000,000. I find that  $I^{TR} \times \overline{I^{BA}}$  is a positive and significant determinant of transaction cost in all four regressions, and that  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  is a negative and significant determinant in regressions describing the cost of transactions of par value equal to \$20,000, \$50,000, and \$100,000. The significance and similar magnitude of parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}}$  in all four regressions suggests that the additional change in transaction cost dependent on the classification of firms engaging in customer transactions may not relate to the temporary rule but instead to other factors that would have a more systematic effect on the cost of all transactions regardless of size. The sign and significance of the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  indicate an additional decrease in retail transaction cost for those bonds relating to non-fiduciary states and with a greater proportion of transactions by BA firms. Although this additional decrease is greater for transactions relat-

ing more to retail investors, the tests below indicate that it may not relate to the additional increase in retail sales found in Section IV.

Among the other control variables, bond characteristics that are positive and significant determinants of retail transaction cost include bond maturity, optional call schedules, odd interest payment frequency, and state median income. Credit enhancements are also positively and significantly related to retail transaction cost, but more so prior to the temporary rule adoption than after; although the credit enhancement indicator variable is positive and statistically significant, the interaction term between the credit enhancement indicator variable and  $I^{TR}$  is negative and statistically significant. Retail transaction cost is also lower for bonds with total par offering amount. The sign and significance of many of the control variables are similar to the findings of Harris and Piwowar (2006).

### *V.c Extension*

To investigate whether other events could relate to the changes in transaction cost following the temporary rule adoption, I again partition the full regression sample into calendar quarters and reestimate regression equation (2). In each one of the regressions, the variables of interest are again  $I^{TR} \times \overline{I^{BA}}$  and  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$ .

Table 9a presents the abbreviated regression results describing the cost of transactions of par value equal to \$20,000 and \$50,000, and Table 9b presents the abbreviated regression results describing the cost of transactions of par value equal to \$100,000 and \$1,000,000. I find that  $I^{TR} \times \overline{I^{BA}}$  is positive in all regressions, and significant in at least one regression relating to each transaction size and quarter. On the other hand, I find that  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  is negative and statistically significant in the regressions describing the transaction cost of bonds with offering dates in the second quarter and in the third quarter following the temporary rule adoption. This result indicates that the time periods in which I find an additional decrease in retail transaction cost by BA firms relative to B firms in non-fiduciary states only partially overlaps the time periods in which I find an additional increase in retail sales. These two results, therefore, may not be related. Taken together, I do not find

enough evidence to conclude that changes to the regulatory regime governing the principal transactions of investment grade municipal bonds relate to changes in transaction cost that is specific to retail investors.

## VI. Conclusion

This paper is a first step in determining the importance of regulatory regimes to the provision of personalized investment advice about securities to retail investors. Broker-dealers and investment advisers may provide many of the same services yet are subject to two different legal frameworks. The results in this paper indicate that differences between the two regulatory regimes may be important to the advice retail investors receive.

This paper investigates just one aspect of the many services broker-dealers and investment advisers may provide. Although I utilize transaction level data, regulatory events, and additional information like state laws, the lack of account level information limits the efficacy of the empirical methodology. Both regulators and researchers would greatly benefit from information describing investor demographics, account characteristics, the types of security investments, and security returns. Such information can not only provide a more meaningful description of a market characterized by information asymmetries, but also an industry that is vital to the financial well-being of many retail investors.

# Appendix

## A.1 *MSRB RTRS Dataset*

There are 35,169,982 transaction observations in the MSRB dataset from July 2005 to December 2008.<sup>29</sup> The dataset reduces to 11,065,403 observations after I exclude bonds with missing issuance or bond information on Mergent, and bonds not meeting sample requirements (see Section II.b), and further reduces to 6,046,632 observations after I exclude transactions with missing trade date, time of trade, transaction price, and par amount information; inaccurate trade date information; and transactions with trade dates not within 60 trading days of the bond offering date.

I also exclude managed account transactions, or where an intermediary acts on the behalf of multiple customers and allocates securities across accounts. These transactions may appear in the dataset as a contemporaneous purchase and then sale to multiple customers at the same time and price with equal par amounts. There are 5,993,465 observations after combining multiple transactions with these similarities to one.

I identify observations with inaccurate transaction prices by comparing the price of an observation to the offering price of the bond and the prices of transactions that immediately precede and follow the observation. For each comparison price (relating to the offering price, the transaction price immediately preceding the observation, and the transaction price immediately following the observation), I calculate a measure equal to the absolute value of the observation price minus the comparison price, all divided by the observation price. I then separately rank each one the three sets of comparison measures. I classify a price as inaccurate with respect to one of the three comparison prices if it ranks in the top 0.05%. I choose 0.05% by examining outliers in the remaining sample when the threshold ranges from 0.01% to 0.1%.

---

<sup>29</sup>After August 2007, the original dataset separates each interdealer transaction into two observations. However, the original dataset also contains a field assigning each interdealer transaction an identification code. I use the identification code to combine the duplicate interdealer transactions. If I cannot match interdealer transactions on identification code, then I match on trade information. I assume the remaining interdealer transactions are non-duplicative.

I delete all individual observations from the sample where each one of the three comparison measures classify as inaccurate and the prices of the transactions immediately following and preceding the observation are also not inaccurate with respect to the next closest transaction. I also exclude all observations relating to a particular bond if an individual observation is inaccurate with respect to the offering price but I cannot delete it from the sample. This can occur when bond prices are inaccurate with respect to the offering price in consecutive transactions. I exclude 5,911 observations from the sample using this methodology, and I also exclude an additional 40,487 observations with bond price less than or equal to 0.01.

I also clean the dataset using par value traded information. I exclude observations with par value traded greater than total par offering amount. I also identify duplicate observations in the dataset by aggregating the par value traded to customers. I consider identical observations to be duplicate if the total par value sold to customer accounts is greater than the total par offering amount by the par value traded. I exclude 369 transactions that are duplicate and 2,209 observations with par traded greater than total par offering amount. Past researchers have taken additional steps to refine the MSRB transaction dataset. The additional refinements, however, impose additional assumptions on the dataset. There are 5,944,489 observations before excluding additional observations relating to agency transactions, and bonds that are not investment grade from the final sample.

## *A.2 Bond Characteristic Variables*

The following is a list of bond characteristic indicator variables that I use in the regressions as explanatory variables. I define each variable with information from the Mergent dataset.

- *AAA* - equal to 1 if the bond has an investment grade rating of AAA, 0 otherwise
- *OptCallSched* - equal to 1 if the bond has an optional call schedule, 0 otherwise
- *ExtraOrdCall* - equal to 1 if the bond issue is subject to an extraordinary call, 0 otherwise

- *PutOption* - equal to 1 if the bond has a put option, 0 otherwise
- *CredEnh* - equal to 1 if the bond has either additional credit or bond insurance, 0 otherwise
- *SinkFund* - equal to 1 if the bond has a sinking fund provision, 0 otherwise
- *OddIntFreq* - equal to 1 if the frequency of interest payments is not semi-annual, 0 otherwise
- *OddIntCalc* - equal to 1 if the interest calculation is not 30 days per month by 360 days per year, 0 otherwise
- *GenObl* - equal to 1 if the security is a general obligation bond, 0 otherwise
- *RevBond* - equal to 1 if the security is a revenue bond, 0 otherwise
- *GenPurp* - equal to 1 if the security is for general purpose or public improvement, 0 otherwise
- *Education* - equal to 1 if the use of proceeds relates to higher education, primary and secondary education, and other education; 0 otherwise
- *Utility* - equal to 1 if the use of proceeds relates to public utilities including power, gas telephone, water, and waste; 0 otherwise
- *Health* - equal to 1 if the use of proceeds relates to hospitals, nursing homes, and other healthcare; 0 otherwise
- *CertPart* - equal to 1 if the type of debt is a certificate of participation, 0 otherwise
- *FedTax* - equal to 1 if the maturity is taxable at the federal level, 0 otherwise
- *StateTax* - equal to 1 if the maturity is taxable by the state of issue, 0 otherwise

I also include an interaction term between *CredEnh* and  $I^{TR}$  ( $CredEnh \times I^{TR}$ ) to control for the potential change to the influence of credit enhancements on bond transactions as a result of the financial crisis.

### A.3 *Harris and Piwowar (2006) Methodology*

I follow Harris and Piwowar (2006) and model bond price  $P$  as a function of bond value  $V$ , investor transaction cost  $C$ , and interdealer price concession  $\delta$ . Transaction cost is dependent on whether the bond transaction is a dealer sale to a customer, a dealer purchase from a customer, or an interdealer transaction. To incorporate differences in transaction type, investor transaction cost is interacted with variable  $Q$ , equal to 1 if the transaction is a dealer sale to a customer, equal to -1 if the transaction is a dealer purchase from a customer, and equal to 0 if the transaction is an interdealer trade. Interdealer price concession  $\delta$  is interacted with an indicator variable  $I^D$ , equal to 1 if the trade is an interdealer trade, and equal to 0 otherwise. In equation form, the price for bond  $i$  at time  $t$  is

$$P_{it} = V_{it} + Q_{it}P_{it}C_{it} + I_{it}^D P_{it}\delta_{it}$$

After taking the natural log of both sides of the bond price equation, the price equation for bond  $i$  at time  $t$  is subtracted from the price equation for bond  $i$  at time  $s$ . Following the approximations made by Harris and Piwowar (2006), the equation for the difference in bond price from time  $s$  to time  $t$  is

$$r_{its}^P = r_{ts}^V + Q_{it}C_{it} - Q_{is}C_{is} + I_{it}^D\delta_{it} - I_{is}^D\delta_{is}$$

where  $r^P$  represents the difference in the natural log of bond price and  $r^V$  represents the difference in the natural log of bond value. I define time  $s$  using the most recent bond trade, either customer or interdealer, prior to the trade at time  $t$ . If more than one bond transaction occurs at time  $s$ , then I use the bond transaction with greatest par value to calculate returns for transactions that occur at time  $t$ . Large transactions, typically involving institutional investors, are likely to provide more information than small transactions, possibly involving

retail investors. If more than one transaction occurs at time  $t$ , then time  $s$  is equal to time  $t$ . In this instance, I use the transaction with the greatest par amount to calculate differences in the natural log of bond price.

Harris and Piwovar (2006) model the difference in the natural log of bond value between the two trades as

$$r_{its}^V = N_{ts}^{CalDay}(5\% - Coupon_i) + \beta_1^V AvgSL_{ts} + \beta_2^V DiffSL_{ts} + \gamma_{its}$$

where  $N_{ts}^{CalDay}$  represents the number of calendar days between time  $s$  and time  $t$ ,  $(5\% - Coupon)$  represents the difference between the bond's coupon interest rate and 5%,  $AvgSL$  represents the average in and  $DiffSL$  represents the difference between short-term and long-term index returns, and  $\gamma$  is model error. The difference between the bond's coupon rate and 5%, in units of one calendar day, measures the return a trader would expect between trade dates when interest rates are constant. The expression of all bond returns in this manner, including when calculating bond index returns, should not affect the results. The error term  $\gamma$  has mean zero and variance equal to  $N_{ts}^{TrdSes} \sigma_{TrdSes}^2$  where  $N_{ts}^{TrdSes}$  represents the number of trading sessions from time  $s$  to time  $t$ . I estimate index returns using a repeat sales regression methodology (Case and Shiller; 1987).<sup>30</sup>

Harris and Piwovar (2006) model transaction cost as a three or four term function. The primary cost function in their analysis is

$$C_i = c_0 + c_1 S_i^{-1} + c_2 \ln S_i + \kappa_i$$

where  $c_0$ ,  $c_1$ , and  $c_2$  represent model parameters;  $S$  represents transaction size; and  $\kappa$  represents model error. They motivate the equation as one part that controls for cost as a proportion of transaction size ( $c_0$ ), one part that controls for fixed costs per trade, ( $c_1 S^{-1}$ ), and one part that controls for cost as it varies with transaction size ( $c_2 \ln S$ ).

The bond price equation is modeled separately for each bond. The full bond price

---

<sup>30</sup>See Appendix A.4 for a full explanation of the repeat sales regression methodology.

equation is

$$r_{its}^P - N_{ts}^{CalDay}(5\% - Coupon_i) = \beta_1^V AvgSL_{ts} + \beta_2^V DiffSL_{ts} + Q_{it} C_{it} - Q_{is} C_{is} + \eta_{its} \quad (3)$$

where  $\eta$  represents model error. The error term  $\eta$  can be expressed as

$$\eta_{its} = \gamma_{its} + I_{it}^D \delta_{it} - I_{is}^D \delta_{is} + Q_{it} \kappa'_{it} - Q_{is} \kappa'_{is}$$

with zero mean and variance,  $\sigma_\eta^2$ , that can be expressed as

$$\sigma_\eta^2 = N^{TrdSes} \sigma_{TrdSes}^2 + D_{ts} \sigma_\delta^2 + (2 - D_{ts}) \sigma_\kappa^2$$

where  $D_{ts}$  is equal to the number of interdealer transactions between each of the two trades (0, 1 or 2),  $\sigma_\delta^2$  represents the variance of  $\delta$ , and  $\sigma_\kappa^2$  represents the variance of  $\kappa$ .

I follow Harris and Piwowar (2006) and use an iterated least squares methodology to estimate parameter estimates of equation (3) with weights equal to the inverse of  $\sigma_\eta^2$  estimates. Estimates of  $\sigma_\eta^2$  are obtained by pooling error terms from equation (3) and regressing the square of these error terms on  $N^{TrdSes}$ ,  $D_{ts}$ , and  $(2 - D_{ts})$ . The parameters multiplying  $N^{TrdSes}$ ,  $D_{ts}$ , and  $(2 - D_{ts})$  are constrained to be strictly greater than zero.

#### A.4 Repeat-Sale Regression

I calculate short-term and long-term bond daily index returns using the repeat-sale regression method of Case and Shiller (1987), regressing the returns of short-term bonds or long-term bonds on a set of indicator variables representing trade dates. I define bonds as short-term if less than 60 months remain until maturity, and bonds as long-term if at least 144 months remain until maturity. The indicator variables,  $I^{td}$ , are equal to 1 if the bond is held or sold on the trade date, 0 otherwise. The repeat-sale regression in equation form for all trades from the beginning of the sample period ( $\tau = 1$ ) to the end of the sample period ( $\tau = T$ ) is

$$r_{its} - N_{ts}^{CalDay}(5\% - Coupon_i) = \sum_{1 \leq \tau \leq T} \beta_\tau I_\tau^{td} + \zeta_{its} \quad (4)$$

where  $r_{its}$  represents the difference in the natural log of the price of bond  $i$  between time  $s$  and time  $t$ ,  $N_{ts}^{CalDay}$  represents the number of calendar days between time  $s$  and time  $t$ , and  $(5\%-Coupon)$  is the difference between the bond's coupon interest rate and 5% in units of one calendar day.

I obtain parameter estimates for both short-term and long-term bonds using a three-step procedure beginning with an initial estimate of equation (4). I then regress the initial squared estimates of  $\zeta$  on the total number of days between consecutive trades, the squared total number of days between trade dates, and an intercept. Lastly, I reestimate equation (4) using fitted values from the second stage as regression weights. I use interdealer transactions only in the repeat-sale regression to avoid noise from the bond prices of customer transactions. If more than one interdealer transaction occurs for the same bond on a given trade date, then I use the last interdealer transaction on that date.

**Figure 1: Changes to the Regulatory Regime Governing the Principal Transactions of Investment Grade Municipal Bonds by Firm and State Classification**

This figure describes the change in the regulatory regime governing principal transactions dependent on firm classification and the presence of state fiduciary laws. For simplicity, this figure does not account for changes to the proportion of advisory accounts held at dual registrant firms following the court decision and temporary rule adoption. See Section II for further discussion.

**Table 1: State Classification by Region**

| <b>Region</b> | <b>Non-Fiduciary States</b>                            | <b>N</b> | <b>Fiduciary States</b>                                                                                                                                       | <b>N</b> |

This table lists the states either classifying as a fiduciary state or a non-fiduciary state by region. A fiduciary state requires broker-dealers to operate in a fiduciary or quasi-fiduciary capacity, whereas a non-fiduciary state makes no such requirements. See Sections II.b and III.c for a further description.

**Table 2: Number and Par Value of Customer Transactions**

This table presents the aggregate number and value of all investment grade municipal bond customer principal transactions. Panel A presents information describing all customer sales and purchases, Panel B presents information describing all sales to customers, Panel C presents information describing all sales to customers less than or equal to \$50,000, and Panel D presents information describing all sales to customers less than or equal to \$20,000. The table presents customer transactions for all firms, for dual registrant firms engaging in principal transactions with brokerage and advisory clients after the temporary rule adoption (BA firms), and for firms engaging in principal transactions with brokerage clients only after the temporary rule adoption (B firms). I obtain transaction information from the MSRB RTRS dataset.

This table reports the results from tobit regressions describing the net par amount sold (*ParSale*) and the net number of municipal bond sales (*NumSale*) to retail investors. The regression model is equation (1). Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm sales, bond characteristics, and state level factors. In these tests, I define retail sales as customer sales with par value less than or equal to \$50,000. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section IV for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

This table reports the results from tobit regressions describing the net par amount sold (*ParSale*) and the net number of municipal bond sales (*NumSale*) to retail investors. The regression model is equation (1). Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm sales, bond characteristics, and state level factors. In these tests, I define retail sales as customer sales with par value less than or equal to \$20,000. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section IV for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

**Table 4: Expected Changes in Retail Sales by Firm and State Classification**

| $I^{TR} =$                                                                                             | $\overline{I^{BA}} = 1, I^{NF} = 1$ |            | $\overline{I^{BA}} = 0, I^{NF} = 1$ |            | $\overline{I^{BA}} = 1, I^{NF} = 0$ |            | $\Delta_1 - \Delta_2 - \Delta_3$ | Bench-<br>mark | $\Delta\%$ |

This table reports estimates of the potential economic significance of a fiduciary standard of conduct. Columns with “ $E[Y]$ ” headers report the unconditional expected value of the dependent variables stemming from the estimation of regression equation (1) given the time period of the retail sales,  $I^{TR}$ , the classification of firms engaging in customer sales,  $I^{BA}$ , and the state classification relating to the bond,  $I^{NF}$ . All other variables are set to its sample mean. The variable  $Y$  represents either *ParSale* or *NumSale*. Columns with “ $\Delta_i$ ” headers report differences between time periods, and the third to last column reports the full difference between all firm and state classifications. I benchmark the full difference with the unconditional expected value of the dependent variables by BA firms in non-fiduciary states prior to temporary rule adoption. The last column relates the full difference to the benchmark. See Section IV for full explanation.

This table reports the abbreviated results from tobit regressions describing the net par amount sold (*ParSale*) and the net number of municipal bond sales (*NumSale*) to retail investors. The regression model is equation (1). I partition the full regression sample by calendar quarter. Q1 - Q4 refer to the first quarter to the fourth quarter following the temporary rule adoption. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm sales, bond characteristics, and state level factors. In these tests, I define retail sales as customer sales with par value less than or equal to \$50,000. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section IV for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

This table reports the abbreviated results from tobit regressions describing the net par amount sold (*ParSale*) and the net number of municipal bond sales (*NumSale*) to retail investors. The regression model is equation (1). I partition the full regression sample by calendar quarter. Q1 - Q4 refer to the first quarter to the fourth quarter following the temporary rule adoption. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm sales, bond characteristics, and state level factors. In these tests, I define retail sales as customer sales with par value less than or equal to \$20,000. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section IV for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

This table reports the abbreviated results from tobit regressions describing the net par amount sold (*ParSale*) and the net number of municipal bond sales (*NumSale*) to institutional investors. The regression model is equation (1). I partition the full regression sample by calendar quarter. Q1 - Q4 refer to the first quarter to the fourth quarter following the temporary rule adoption. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm sales, bond characteristics, and state level factors. In these tests, I define institutional sales as customer sales with par value strictly greater than \$50,000. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section IV for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

This table reports the results from weighted regressions describing the cost of transactions of par value equal to \$20,000 and \$50,000. The regression model is equation (2). I weight observations with the inverse with transaction cost estimate variance. I follow the Harris and Piwovar (2006) methodology. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm transactions, bond characteristics, and state level factors. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section V for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

This table reports the results from weighted regressions describing the cost of transactions of par value equal to \$100,000 and \$1,000,000. The regression model is equation (2). I weight observations with the inverse with transaction cost estimate variance. I follow the Harris and Piwowar (2006) methodology. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm transactions, bond characteristics, and state level factors. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section V for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

**Table 9a: Regressions Describing Transaction Cost by Calendar Quarter**

This table reports the results from weighted regressions describing the cost of transactions of par value equal to \$20,000 and \$50,000. The regression model is equation (2). I partition the full regression sample by calendar quarter. Q1 - Q4 refer to the first quarter to the fourth quarter following the temporary rule adoption. I weight observations with the inverse with transaction cost estimate variance. I follow the Harris and Pivovarov (2006) methodology. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm transactions, bond characteristics, and state level factors. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section V for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

| <i>adj. R</i> <sup>2</sup>                      | 0.22                        | 0.10                        | 0.11                        | 0.19                       |

This table reports the results from weighted regressions describing the cost of transactions of par value equal to \$100,000 and \$1,000,000. The regression model is equation (2). I partition the full regression sample by calendar quarter. Q1 - Q4 refer to the first quarter to the fourth quarter following the temporary rule adoption. I weight observations with the inverse with transaction cost estimate variance. I follow the Harris and Pivovar (2006) methodology. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm transactions, bond characteristics, and state level factors. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section V for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

Dear Dan,

It does not seem like there is an easy solution to your problem, especially in relation to the number of reps that provide advice in DC plans or IRAs, or as you say, provide advice at all. The difficulty to even distinguish between discount BDs and full-service BDs that provide advice is also difficult considering some discount BDs provide advice.

Our best source for these market sizing issues would be the Cerulli reports or anything that we can find online.

**Subject:** RE: Estimate of Affected Broker-Dealer Reps

The Cerulli source is the Advisor Metrics 2011 report-- Exhibit 1.04 "Historical Change in Total Advisors by Channel 2004-2010"  
Also, you'll notice that in Exhibit 1.10 "Top -25 Broker/Dealers by Advisor Headcount 2004-2010" that certain companies like Charles Schwab, Fidelity and Vanguard are omitted. We asked Cerulli about it. Below is our e-mail exchange with them. After reading their responses, I am still unsure whether their counts include all the advice delivering reps we need for our estimate.

Thanks,  
Dan

---

Keith and Dan,

I can answer both questions.

1) When we are sizing advisors, we are scrubbing out RIAs and Series 7 licensed reps that are not providing wealth management services. RIAs have to have at least 25% in Retail Assets and are offering wealth management services to end investor. For example, BlackRock is an RIA but not a Retail RIA.

2) Fidelity and Vanguard are part of our Direct Channel as they are offering centralized advice and therefore not part of our Retail Advisor Sizing.

Let me know if you want to chat this afternoon or anytime this week and will be happy to discuss further.

Best,  
Austin

Subject: questions for analyst

---

Hi Austin,

Here are a couple questions we have for an analyst. These questions are on the 2011 Advisor Metrics report.

- 1) Exhibit 1.04 – Where do the advisor numbers come from? According to the SEC, there are over 600,000 broker-dealers, but the chart lists much fewer of them as advisors. How do you define/determine which of them are advisors? Similarly for RIAs, according to the SEC Dodd-Frank report, there are about 275,000 state registered RIAs, but the number of RIA advisors in the chart is much lower.
- 2) Exhibit 1.10 – Why don't Fidelity and Vanguard appear on the list? Are their representatives not registered as broker-dealers, or are they broker-dealers, but not considered to be advisors?

We are available tomorrow, Friday, or next Monday or Tuesday to discuss these questions.

Thanks,  
Keith

**Subject:** Estimate of Affected Broker-Dealer Reps

Hi Matt,

I have a question that relates to our cost benefit analysis and was hoping you could help. We anticipate that by changing the definition of fiduciary under ERISA, certain service providers and their reps will incur higher liability costs (in the form of higher errors and omissions insurance). Thus, we need an estimate of the number of broker-dealer reps who might be facing higher liability insurance as a consequence of performing functions that will newly be held to a fiduciary standard.

To get this estimate, we need a count of the number of BD reps who deliver advice in the retail market. The SEC's Dodd-Frank Report ([www.sec.gov/news/studies/2011/913studyfinal.pdf](http://www.sec.gov/news/studies/2011/913studyfinal.pdf)) estimated that there were 600,000 BD reps. However, it is my understanding that many of these reps do not provide advice to retail investors in DC plans or IRAs (or provide advice at all). Cerulli Associates' *Advisor Metrics 2011* estimates that there are approximately 300,000 BD reps who qualify as "advisors". Do you think this number is more appropriate, or would some other source be better? Any assistance you could provide would be very useful.

Best,  
Dan

Hello All,

On Thursday, October 17<sup>th</sup>, we will welcome Matthew Kozora, an economist at the Securities and Exchange Commission, to present his work on "The Effect of Regulatory Regimes on the Provision of Retail Investment Advice." The paper is available at SSRN ([http://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=2323519](http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2323519)), and I have attached a copy below. Matt's work has close ties to our conflicted advice project, and may have implications for the regulatory impact analysis. I hope others (not involved in the conflicted advice project) will be interested in this work as an example of how to examine the effects of rulemaking.

I do not anticipate having slides for the presentation; Matt will present from the paper.

# The Effect of Regulatory Regimes on the Provision of Retail Investment Advice<sup>\*,\*\*</sup>

Matthew L. Kozora

09/09/2013

Division of Economic and Risk Analysis

U.S. Securities and Exchange Commission

*Working Paper*

## Abstract

Broker-dealers and investment advisers are two separate types of financial intermediaries subject to different regulatory regimes that can provide personalized investment advice about securities to investors. In this paper, I investigate whether differences between the broker-dealer regulatory regime and the investment adviser regulatory regime may be significant to retail investment advice by examining the principal transactions of investment grade municipal bonds. The results in this paper indicate that the advice retail investors receive may be dependent on the legal framework governing its provision. In particular, I find evidence of a potential relationship between the standards under which broker-dealers and investment advisers provide advice and the sale of investment grade municipal bonds to retail investors.

*Keywords: Retail Investors, Broker-Dealers, Investment Advisers, Fiduciary Standard of Conduct, Municipal Bonds*

## I. Introduction

Investors can receive personalized investment advice about securities (or “personalized investment advice”) from two regulated types of financial intermediaries, broker-dealers and investment advisers, that may provide similar services but are subject to two different and

separate regulatory regimes. At the federal level, firms registered as broker-dealers are subject to the Securities Exchange Act of 1934 (or “Exchange Act”) and the rules thereunder, and the rules of self-regulatory organizations (or “SROs”), whereas firms registered as investment advisers are subject to the Investment Advisers Act of 1940 (or “Advisers Act”) and the rules thereunder. A firm registered as both a broker-dealer and an investment adviser (or “dual registrant firm”) may provide both brokerage and advisory services, and depending on whether the account is a brokerage account or an advisory account, be subject to the rules of either regulatory regime.<sup>1</sup>

Little to no research currently exists indicating whether differences between the broker-dealer and the investment adviser regulatory regimes can be significant to the advice retail investors receive in non-discretionary accounts.<sup>2</sup> In this paper, I investigate the effect of regulatory regimes by examining the principal transactions of investment grade municipal bonds.<sup>3</sup> I find evidence that suggests the regulatory regime, in particular the standards under which advice is given, may be significant to the advice retail investors receive.

I use investment grade municipal bonds in this study for two primary reasons. First, retail investors are major participants in the municipal bond market, individually investing in close to one-half of all municipal bonds outstanding.<sup>4</sup> The illiquidity and opacity of the municipal securities market (SEC; 2012a) also increases the importance of a financial agent

---

<sup>1</sup>A recent study by U.S. Securities and Exchange Commission (SEC) staff on investment advisers and broker-dealers as pursuant to Section 913 of the Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010 (or the “913 Study”) provides an in-depth review of the two regulatory regimes.

<sup>2</sup>The focus of this paper is the provision of personalized investment advice in non-discretionary accounts. A non-discretionary account does not provide a financial agent authority to transact securities without the consent of the account holder, whereas a discretionary account grants such authority. Recent estimates place the number of non-discretionary advisory accounts managed by federally registered investment advisers at 5 million, and the number of brokerage accounts at federally registered broker-dealers at 110 million. Both estimates include both institutional and retail accounts. Investment adviser information can be found at [www.sec.gov/foia/iareports/inva-archive.htm](http://www.sec.gov/foia/iareports/inva-archive.htm). The broker-dealer estimate includes both non-discretionary and discretionary accounts, and can be found in SEC (2011). I will refer to advisory clients with non-discretionary accounts as “advisory clients” or “clients,” brokerage customers with non-discretionary accounts as “brokerage customers” or “customers,” and brokerage customers and advisory clients generally as “investors.”

<sup>3</sup>A principal transaction is a transaction where the broker-dealer or investment adviser buys or sells securities for its own account.

<sup>4</sup>The estimate is as of the third quarter 2012, and can be found in the *Flow of Funds Accounts of the United States* statistical release, published by the Federal Reserve.

to provide advice to their customer or client.

Second, I use investment grade municipal bonds to incorporate a regulatory event into the empirical methodology. The regulatory event is the October 2007 adoption of a temporary SEC rule (or “temporary rule”). The temporary rule, among other things, established an alternative set of principal transaction disclosure and consent requirements under the Advisers Act for investment advisers also registered as broker-dealers. Prior to the temporary rule adoption, dual registrant firms typically did not engage in principal transactions with advisory clients, engaging in principal transactions with brokerage customers only.<sup>5</sup> Dual registrant firms adhering to the temporary rule (or “BA firms”) began engaging in principal transactions with both brokerage customers and advisory clients. Other firms, including all firms registered solely as broker-dealers and those dual registrant firms not adhering to the temporary rule (or “B firms”), continued to engage in principal transactions with brokerage customers only.<sup>6</sup> The temporary rule, still in effect at the time of this writing, does not permit a firm to rely on the rule for securities that it or an affiliated entity underwrites or issues except for non-convertible investment grade debt. I therefore use municipal bonds of investment grade only to be certain that the temporary rule can apply to all principal transactions in the empirical sample.<sup>7</sup>

The time period of the study is from January 2006 to December 2008. Broadly, I investigate whether regulatory regimes may be significant to the provision of personalized investment advice by comparing the change to the principal transactions of BA firms following the temporary rule adoption with the change to the principal transactions of B firms. If adherence to the temporary rule and the recommendation and transaction of investment

---

<sup>5</sup>In the initial temporary rule release, the SEC describes discussions with representatives of dual registrant firms regarding the difficulties of complying with the disclosure requirements under Section 206(3) of the Advisers Act (SEC; 2007). Firms explained that they typically did not engage in principal transactions with advisory clients as a result of the operationally restrictive disclosure requirements. The temporary rule has since been extended to December 31, 2014. See Section II.a for further explanation.

<sup>6</sup>I utilize municipal bond transaction data from the Municipal Securities Rulemaking Board (MSRB) Real-time Transaction Reporting System (RTRS). MSRB requires all broker-dealers and municipal securities dealers to report the transactions of municipal securities. Consequently, no firms in the sample are registered solely as investment advisers.

<sup>7</sup>See Section II.a for a further discussion of the temporary rule.

grade municipal bonds subject to the investment adviser regulatory regime is significant, then I may observe a difference in the change in principal transactions between BA firms and B firms as BA firms apply the temporary rule and the investment adviser regulatory regime to activities that would have otherwise been subject to only the broker-dealer regulatory regime.

As part of the empirical methodology, I specifically investigate whether the standard of conduct as required by federal and state law may be significant to the provision of personalized advice to retail investors.<sup>8</sup> At the federal level, an investment adviser is a fiduciary who is to serve in the best interests of its clients, including an obligation not to subordinate the clients' interests for their own and to disclose or eliminate all material conflicts of interest, whereas broker-dealers are required to deal fairly with their customers and in most instances are not considered a fiduciary. At the state level, broker-dealers may be subject to a fiduciary standard of conduct (SEC; 2011).<sup>9</sup>

I refine the broad comparison between BA firms and B firms to the state level, and compare the difference in the change in principal transactions between the two firm classifications between states where broker-dealers may be subject to additional standards of conduct that relate to a fiduciary standard of conduct (i.e., "fiduciary states") and states where broker-dealers are generally not subject to a fiduciary standard of conduct (i.e., "non-fiduciary states"). I assume, similar to the equity "home bias" (Coval and Moskowitz; 1999), that retail investors purchase the bonds of local or within-state municipalities.<sup>10</sup> By assumption, additional state standards of conduct would apply to the principal transactions of the municipal securities relating to the state.

Adherence to the temporary rule by BA firms in non-fiduciary states brought about the

---

<sup>8</sup>Other differences between the two regulatory regimes include disclosure requirements, supervisory and control procedures, continuing education requirements, and restrictions on advertising and other communications. The investment adviser regulatory regime is also largely principles-based and not predominately rules-based like the broker-dealer regulatory regime.

<sup>9</sup>See Section II.b for a further discussion of standards of conduct.

<sup>10</sup>Exemption from state and local taxes may also induce retail investors to purchase bonds of local or within-state municipalities (SEC; 2012a).

introduction of a fiduciary standard of conduct to the portion of investment grade municipal bond recommendations and transactions with advisory clients that would have otherwise been with brokerage customers, whereas adherence to the temporary rule by BA firms in fiduciary states did not result in a similar introduction of a fiduciary standard of conduct. Regardless of the presence of state fiduciary laws, the standard of conduct governing the recommendation and transaction of investment grade municipal bonds by B firms did not change following the temporary rule adoption as these firms continued to engage in principal transactions with brokerage customers only. Taken together, changes to the principal transactions of BA firms relative to B firms in fiduciary states may relate to the temporary rule and the investment adviser regulatory regime, but not a fiduciary standard of conduct, and changes to the principal transactions of BA firms relative to B firms in non-fiduciary states may relate to the temporary rule and the investment adviser regulatory regime including a fiduciary standard of conduct. An additional difference between BA firms and B firms in non-fiduciary states relative to fiduciary states, therefore, may relate to a fiduciary standard of conduct.

In the first set of tests, I investigate the effect of regulatory regimes on security recommendations by examining the sale of investment grade municipal bonds to retail investors. I do not find evidence indicating a difference in the change in sales to retail investors between BA firms and B firms following the temporary rule adoption in fiduciary states, but I do find evidence of additional sales to retail investors by BA firms relative to B firms in non-fiduciary states. Thus, I find evidence suggesting that a fiduciary standard of conduct may relate to the recommendation and sale of investment grade municipal bonds to retail investors, but no evidence that application of the temporary rule or other aspects of the investment adviser regulatory regime were also significant in explaining retail sales. In additional tests, I find that the relative increase in sales to retail investors by BA firms in non-fiduciary states was most significant soon after the temporary rule adoption. This result suggests that the increase in sales by BA firms in non-fiduciary states may relate more to the temporary rule

adoption and less to other factors which may also had an effect including events relating to the recent financial crisis.

In the second set of tests, I investigate the effect of regulatory regimes on the markup/markdown on, or the “transaction cost” (Harris and Piowar; 2006) of, investment grade municipal bonds. The implementation of policies and procedures to adhere to the temporary rule may have led to an increase in the compliance costs of BA firms. The increase in compliance costs may have resulted in higher transaction costs for retail investors who may have less access to pricing information than institutional investors (SEC; 2012a).<sup>11</sup> Research by Green, Hollifield, and Schürhoff (2007a) find evidence of differences in the level of informed trading between retail investors and institutional investors; transactions of smaller size, relating to retail investors, often exhibit less advantageous prices and a greater range of prices than the transactions of larger size, relating to institutional investors. I continue to distinguish bonds by state classification to investigate whether the additional increase in sales to retail investors by BA firms relative to B firms in non-fiduciary states was contemporaneous with an additional change in retail transaction cost.

I find evidence of an increase in transaction cost by BA firms relative to B firms following the temporary rule adoption in fiduciary states, but that the increase in transaction cost was not specific to retail transactions but also present in institutional transactions. Thus, I do not find evidence indicating that adherence to the temporary rule led specifically to additional retail investor transaction costs but instead find evidence of a more systematic change to the cost of all BA firm transactions. I also find evidence indicating an additional decrease in the cost of retail transactions by BA firms relative to B firms following the temporary rule adoption in non-fiduciary states. The time periods in which I find the additional decrease in transaction cost, however, only partially aligns with the time periods in which I find the additional increase in retail sales. Taken together, I do not find sufficient evidence in these

---

<sup>11</sup>See Section II.a for a further discussion of the requirements of the temporary rule. The markup/markdown bond traders set on firm inventory, especially for transactions that are more arm’s length, presumably would not be dependent on the account type of the investor and the regulatory regime under which the registered representative provides recommendations.

tests to conclude that changes to the regulatory regime stemming from the temporary rule adoption had an effect, either directly or indirectly, on the cost of retail transactions.

The results in this paper only provide suggestive evidence of the effects of regulatory regimes as a result of conducting tests at the firm level and not at the account level. Tests at the account level would require information describing the type of investor account, whether the transaction was solicited or unsolicited, and investor characteristics.<sup>12</sup> Other factors may be important in explaining the test results. I attempt to control for these other factors by comparing principal transactions between time periods, firms, and states, and controlling for differences between bonds, firms, and states with additional explanatory variables.

This is the first paper to empirically investigate the effect of regulatory regimes on the advice retail investors receive. The appropriate standard of conduct for broker-dealers and investment advisers is the subject of an ongoing debate among federal agencies, industry representatives, and investor advocacy groups. Some believe that a uniform fiduciary standard at the federal level applied across broker-dealers and investment advisers would provide additional retail investor protections, whereas others believe that a fiduciary standard of conduct applied to the broker-dealer regulatory regime would increase firm costs with little benefit and would ultimately result in reduced investor access to advice.<sup>13</sup> Examples of firm costs include ongoing costs relating to “back-office” functions, other compliance costs, and litigation costs.

Past research relating to the provision of financial advice typically investigates its net benefit or quality, and investigates only one type of financial agent or makes no distinction. Recent examples include Chalmers and Reuter (2011) who investigate the performance of

---

<sup>12</sup>The SEC recently requested data and other information relating to the benefits and costs of the standards of conduct and other obligations of broker-dealers and investment advisers (SEC; 2013). Examples of requested data and information include the types of services available to retail investors, the types of securities financial agents offer or recommend, and the costs to financial agents of providing personalized investment advice about securities.

<sup>13</sup>Comments to the 913 Study, including one by Oliver Wyman and the Securities Industry and Financial Markets Association, dated October 27, 2010, and one by State Farm VP Management Corporation, dated August 27, 2010, describe the potential costs of broker-dealers shifting to a fiduciary standard of conduct. All comment letters to the 913 Study and to a subsequent request for information and other data (SEC; 2013) can be found at <http://www.sec.gov/comments/4-606/4-606.shtml>.

brokerage customer retirement portfolios; and Mullainathan, Nöth, and Schoar (2011) who investigate the quality of investment advice provided by financial agents in an audit study.<sup>14</sup> These examples, as well as other research utilizing international data, indicate that retail investors do not always receive beneficial investment advice.<sup>15</sup> Other research finds conflicts of interest may partially determine the advice investors receive. For example, Bergstresser, Chalmers, and Tufano (2009) find that funds sold through an intermediary underperform funds sold directly to investors, and that the sale of underperforming funds may stem from conflicts of interest as a result of intermediary sales incentives.<sup>16</sup> I find that the advice investors receive may be partially determined by the regulatory regime governing its provision, and that investment advice should be evaluated in this respect.

Although the focus of this paper is on the provision of personalized investment advice, it also contributes to the municipal bond literature investigating municipal securities markets including Harris and Piwowar (2006); Green, Hollifield, and Schürhoff (2007a); Green, Hollifield, and Schürhoff (2007b); Green, Li, and Schürhoff (2010); Li and Schürhoff (2012); and Schultz (2012). I find evidence that the regulatory regime governing the provision of personalized investment advice may be an important determinant in the transaction of these securities, especially with respect to retail investors.

I organize the rest of the paper as follows: Section II provides additional regulatory background information, Section III describes the data, Section IV describes the tests of sales to retail investors, Section V describes the tests of transaction cost, and Section VI concludes.

---

<sup>14</sup>In relation to this paper, it is unclear whether Mullainathan et al. (2011) conduct audits of broker-dealers, investment advisers, or both. For instance, their use of the term “investment advisers” relates to “retail advisers whom the average citizen can access via their bank, independent brokerages, or investment advisory firms.” Thus, their definition of investment adviser seemingly incorporates both broker-dealers and investment advisers.

<sup>15</sup>Examples of research utilizing international data to investigate the quality of investment advice include Bhattacharya, Hackethal, Kaesler, Loos, and Meyer (2012); Fecht, Hackethal, and Karabulut (2010); Bluethgen, Meyer, and Hackethal (2008); Bluethgen, Gintschel, Hackethal, and Müller (2008); Karabulut (2011); Kramer (2009); and Kramer and Lensink (2009).

<sup>16</sup>Other work examining the distribution of mutual funds include Del Guercio and Reuter (2011); Del Guercio, Reuter, and Tkac (2010); and Christoffersen, Evans, and Musto (2013).

## II. Regulatory Background

This paper investigates the effect of regulatory regimes on the provision of personalized investment advice to retail investors. The null hypothesis is that the temporary rule and differences between the regulatory regimes do not matter to the principal transactions of investment grade municipal bonds relating to retail investors. The alternative hypothesis is that the temporary rule and differences between the regulatory regimes do matter to the principal transactions of investment grade municipal bonds relating to retail investors. Below, I provide additional background on the temporary rule, the investment adviser regulatory regime, and fiduciary standards of conduct. Figure 1 provides a diagram of the changes to the regulatory regime governing the principal transactions of investment grade municipal bonds by firm and state classification during the sample period.

### II.a *Changes to the Regulatory Regime Governing Principal Transactions*

The temporary rule establishes an alternative means for dual registrant firms to meet the requirements under Section 206(3) of the Advisers Act when engaging in principal transactions with non-discretionary advisory clients (SEC; 2007). The temporary rule, adopted in October 2007, was in direct response to a March 2007 court decision (*Financial Planning Association v. U.S. Securities and Exchange Commission*) overturning an SEC rule exempting broker-dealers from the definition of “investment adviser” when charging non-transaction based compensation (or “fee-based” brokerage accounts).<sup>17</sup>

Section 206(3) of the Advisers Act requires an investment adviser to provide written conflict-of-interest disclosure describing its role as principal when transacting securities from its own account and obtain client consent prior to transaction completion. The temporary rule provides a dual registrant firm the option of providing transaction-by-transaction disclosures verbally instead of in writing when engaging in principal transactions with non-

---

<sup>17</sup>Non-transaction based fees include fees based on the amount of assets under management. A consequence of the court decision was the requirement that dual registrant firms and broker-dealers treat fee-based brokerage accounts as advisory accounts, and that the firms as a result became subject to the restrictions of the Advisers Act when engaging in principal transactions. The temporary rule was adopted so that dually registered advisers could continue to engage in principal transactions with the customers of these accounts.

discretionary advisory clients as long as the firm satisfies additional requirements. Additional requirements of the temporary rule include the provision of a written prospective disclosure to clients describing the conflicts arising from principal transactions, acquisition of written revocable client consent prospectively authorizing such transactions, the provision of transaction-by-transaction confirmations, and the provision of annual reports itemizing the clients' principal transactions thereafter. The temporary rule does not relieve the obligations of the investment adviser regulatory regime including its fiduciary standard of conduct. Moreover, dual registrant firms engaging in principal transactions with advisory clients must also still adhere to the broker-dealer sales practice and best-execution obligations set by the SEC and SROs (SEC; 2007).

There are two primary changes to the regulatory regime governing the recommendation and transaction of investment grade municipal bonds stemming from adherence to the temporary rule which may have led to a change in sales to retail investors and retail transaction cost. The first primary change is the rules and requirements of the temporary rule itself. A dual registrant firm cannot rely on the rule for securities it or an affiliated entity underwrites or issues except for investment grade non-convertible debt. This restriction may have possibly resulted in a shift in sales from other securities to investment grade municipal bonds. Adherence to the temporary rule may have also led to an increase in compliance costs which may have been passed on to investors in the form of higher transaction costs. Compliance costs include the provision of written prospective disclosures, acquisition of written revocable client consent, and the implementation of systems to monitor adherence to the rule.

The second primary change is the application of the rules and requirements of the investment adviser regulatory regime, not including the rules and requirements of the temporary rule, to the recommendation and transaction of investment grade municipal bonds. The provision of personalized investment advice subject to the investment adviser regulatory regime, including a fiduciary standard of conduct, may have led to a change in security

recommendations retail investors receive and the cost of providing advice.<sup>18</sup>

Both primary changes may in some form have contributed to the results found below.<sup>19</sup> The results suggest that the introduction of a fiduciary standard of conduct to the recommendation and transaction of investment grade municipal bonds by BA firms in non-fiduciary states may have led to greater sales to retail investors.

## II.b *Standards of Conduct*

At the federal level, investment advisers are fiduciaries to their clients, whereas broker-dealers generally are not fiduciaries to their customers.<sup>20</sup> Both regulatory regimes provide protections to retail investors from abusive practices. Such protections include the obligation to seek best execution on customer or client orders, and the provision of investment advice which is suitable and in the best interests of their customers or clients. As part of a fiduciary duty, investment advisers also have an obligation to place the clients' interests in front of their own and to disclose or eliminate all material conflicts of interest.

In some states, broker-dealers are subject to a fiduciary standard of conduct (SEC; 2011). I assume that in practice standards of conduct, either directly or indirectly, are constraints to

---

<sup>18</sup>See footnote 13 and related text.

<sup>19</sup>Two other secondary changes may have also led to a change in security recommendations and transaction cost. The first of these secondary changes is the possible change in the number and the characteristics of investors with access to investment grade municipal bonds. As a result of the temporary rule, investment advisers at BA firms have greater ability to recommend certain securities from firm inventory to their advisory clients. If some advisory clients did not have access to these securities such as through additional brokerage accounts prior to the temporary rule adoption, then the adherence to the temporary rule may have changed the population of investors with access to these securities.

The second of these secondary changes is the change in the form of financial agent compensation for those customers transferring assets from fee-based brokerage accounts to commission-based brokerage accounts. Financial agents compensated with commissions may be more inclined to recommend securities not intended to be invested in long-term to collect transaction based fees. On the other hand, financial agents compensated with fees based on the amount of assets under management may be more inclined to recommend securities intended to be invested in long-term to avoid transaction costs.

Both the possible change in the population of investors with access to securities from firm inventory and the form of financial agent compensation would have effects that are more ongoing and that are independent of state fiduciary laws. The results, especially with respect to sales to retail investors, instead indicate that changes to the principal transactions of investment grade municipal bonds is dependent on state classification. It is possible, however, that these secondary changes also had an influence on the test results.

<sup>20</sup>There are differing interpretations as to when broker-dealers have a fiduciary obligation to their customers. The ambiguity stems from a lack of litigated cases impeding the development of case law, variation in customer contracts, and inconsistencies between states (Laby; 2010).

the investment advice financial agents provide. Although firms may not implement control and compliance systems or procedures to address differences in state law, state law may still be important to the provision of personalized investment advice. For instance, in case of customer dispute, federal courts would look to state law to determine the fiduciary obligations of a broker-dealer (Laby; 2010), and arbitrators can apply state laws to determine awards in case of customer arbitration.<sup>21</sup>

### III. Data Description

I obtain information describing the business of dual registrant firms and broker-dealers from public SEC filings, municipal bond characteristics from the Mergent Municipal Bond Securities Database (Mergent dataset) and SDC Platinum, municipal bond transaction data from the MSRB RTRS dataset, and state information from various sources.

The time period of study is from January 2006 to December 2008. I use bonds with offering dates between January 2006 and December 2006, and between October 2007 and September 2008. I choose a short time period to accurately test the change in municipal bond transactions while avoiding to the fullest extent possible the impact of the global financial crisis of 2008. I do not include municipal bonds with offering dates within 60 trading days of the court decision, from January 2007 to March 2007, and between the court decision and the temporary rule adoption, from March 2007 to September 2007, due to the legal uncertainty of the time period. Similar to Green et al. (2007a), my sample includes only bond transactions occurring within 60 trading days of the bond offering date. The 60 trading day window allows me to incorporate the municipal bonds that are the most frequently traded and to limit the number of municipal bonds with trading periods that overlap either the court decision or the temporary rule adoption.

---

<sup>21</sup>Customers of broker-dealers and dual registrant firms, including the advisory clients at dual registrant firms, typically sign pre-dispute arbitration agreements with their financial agent. Training materials from the Financial Industry Regulatory Authority (FINRA), which operates the largest dispute resolution program in the securities industry, guides arbitrators to seek guidance in most cases from the parties involved to determine the applicable law or laws. See *The Neutral Corner*, Volume 3 (2010), published by FINRA, and *Basic Arbitrator Training*, also published by FINRA, for training materials.

### III.a *Broker-Dealer and Dual Registrant Firm Information*

The initial sample of broker-dealers (and dual registrant firms) includes all broker-dealers that engaged in a municipal bond transaction during the sample period and that is reported in the MSRB RTRS dataset. I require all firms to file annual SEC Form X-17A-5 audited reports with information encompassing the sample period to ensure that the sample of broker-dealers does not change from before the court decision to after the temporary rule adoption. Form X-17A-5 is a financial and operational report that must be filed by all broker-dealers registered with the SEC, and can be found on the SEC's EDGAR system. I obtain information describing the firm's investment adviser business, if any, from annual SEC Form ADV filings. Investment advisers and dual registrant firms file Form ADV with the SEC to provide general information including the types of clients, compensation arrangements, and advisory activities. Past Form ADV filings can be found on the SEC's Investment Adviser Public Disclosure website.

I classify a firm as a BA firm if it files Form ADV, reports actively engaging in business as a broker-dealer, reports a positive number of non-discretionary advisory accounts, and reports that it engages in principal transactions with advisory clients. BA firms are only potentially adhering to the temporary rule because firms filing Form ADV do not specifically acknowledge adherence to the rule. A B firm either does not file Form ADV, does not report actively engaging in business as a broker-dealer, does not report a positive number of non-discretionary clients, or does not report that it engages in principal transactions with advisory clients. B firms, therefore, could not be relying on the temporary rule. Because firms generally did not engage in principal transactions with non-discretionary advisory clients prior to the temporary rule adoption, I classify firms using information from the time period following the rule adoption only. To obtain a more direct comparison between firms either adhering to the temporary rule or not adhering to the rule, I exclude firms that are not solely classified as either a BA firm or a B firm as of December 2007 and December 2008. There are 95 BA firms and 1,475 B firms that meet all sample requirements.

### III.b *Municipal Bond Characteristics*

I obtain bond characteristic information from the Mergent dataset. The Mergent dataset provides security and issue information for 484,256 individual bonds with offering dates between July 2005 and December 2008. I extract bond information from the Mergent dataset including the type and frequency of coupon payments, put options, call options, sinking fund provisions, non-standard interest frequency or interest calculation, credit enhancements, tax status, the type of debt-paying assets, and the use of proceeds. I obtain bond ratings information from SDC Platinum.

I exclude 26,075 individual bonds from the initial sample with missing offering price information, missing or inaccurate total offering amount information, remarketed bonds, and bonds not relating to any of the 50 states or the District of Columbia.<sup>22</sup> To incorporate the Harris and Piwovar (2006) bond model in my analysis, I exclude 16,586 individual bonds with a derivative or warrant feature, and 8,346 individual bonds with non-standard coupon payments (adjustable, floating, flexible, variable, inverse, or index-linked coupons). I also exclude 80,986 individual bonds that are either designated as non-investment grade or with missing ratings information in SDC Platinum to ensure that the temporary rule can apply to all bonds in the sample. There are 352,309 bonds remaining in the sample. Bond issuances are spread evenly throughout the sample period. There are 109,168 investment grade municipal bonds meeting sample requirements with offering dates between January 2006 and December 2006, and there are 89,543 investment grade municipal bonds meeting sample requirements with offering dates between October 2007 and September 2008.

### III.c *State Information*

I obtain state law information from Finke and Langdon (2012) who classify states and the District of Columbia into one of three categories based on whether broker-dealers are subject to a fiduciary standard of conduct, a quasi-fiduciary standard of conduct, or no

---

<sup>22</sup>I search for inaccurate total offering amount information by examining individual bonds with total offering amount less than denomination amount. Often these securities are zero-coupon bonds selling at a discount. However, it can also be indicative of data error. I find only a few such examples.

fiduciary standard of conduct. They base their classification scheme on court decisions and state regulations. It is unclear the extent to which state level fiduciary or quasi-fiduciary standards of conduct relate to the fiduciary standard of conduct of the investment adviser regulatory regime. For instance, Finke and Langdon (2012) note that some quasi-fiduciary states “impose a standard higher than the suitability standard imposed by FINRA for non-discretionary accounts.”

From the classification of Finke and Langdon (2012), I define a fiduciary state as a state where broker-dealers are subject to a fiduciary or quasi-fiduciary standard of conduct, and a non-fiduciary state as a state where generally broker-dealers are not subject to a fiduciary standard of conduct. State classifications relate to the standards of conduct governing the provision of advice in non-discretionary accounts. The difference between states is whether broker-dealers are either subject to additional standards of conduct that seemingly relate to a fiduciary standard or are generally not subject to a fiduciary standard of conduct. Table 1 presents a listing of fiduciary states and non-fiduciary states by geographic region. There are 37 fiduciary states and 14 non-fiduciary states. A little more than a quarter of bond issues relate to non-fiduciary states.

I obtain state income information from the U.S. Census Bureau, gross state product statistics from the Bureau of Economic Statistics, and tax information from the Federation of Tax Administrators. I incorporate the information in the regressions below to control for state level economic differences.

#### III.d *Municipal Bond Transaction Data*

I obtain municipal bond transaction data from the MSRB RTRS dataset. The dataset contains information for all municipal bond transactions from July 2005 to March 2009. Each observation provides information regarding bond cusip, trade date, time of trade, settlement date, bond price, par value, and transaction commissions. The dataset also contains fields identifying the transacting broker or brokers, the type of transaction (between two dealers or a dealer and a customer, sale or purchase), and dealer capacity (principal or agent). The

dataset does not contain information describing the type of investor engaging in customer transactions (institutional or retail), the type of customer account (brokerage or advisory), and whether the transaction was solicited or unsolicited. There are 5,382,087 observations relating to the principal transactions of sample investment grade municipal bonds in the final sample. In Appendix A.1, I describe measures to clean the dataset for missing or inaccurate trade dates, inaccurate prices, managed account transactions, and other possible data errors.

Table 2 presents the amount of investment grade municipal bond customer principal transactions relating to firms in the final sample. The table includes four panels presenting the total number and value of all customer transactions (Panel A), the total number and value of all sales to customers (Panel B), the total number and value of all sales to customers less than or equal to \$50,000 (Panel C), and the total number and value of all sales to customers less than or equal to \$20,000 (Panel D). I use sales to customers less than or equal to \$50,000 and less than or equal to \$20,000 to proxy for sales to retail investors. In each panel the table also presents transaction information by firm classification. In no year did B firms engage in more customer transactions or sales to customers than BA firms. Considering the number of BA firms to B firms, the comparison in customer transactions and sales highlights the difference in trading activity between the two classifications of firms.

## IV. Tests of Municipal Bond Sales

### IV.a *Empirical Model*

In the first set of tests, I investigate the effect of regulatory regimes on security recommendations by examining the sale of investment grade municipal bonds to retail investors. I define a transaction as a “retail transaction” if the par amount is less than or equal to \$50,000. Alternatively, I define a transaction as a retail transaction if the par amount is less than or equal to \$20,000. Evidence by Green et al. (2007a) indicates that sales to customers of smaller par amount exhibit greater average markups and intraday price dispersion than sales to customers of larger par amount. The greater price dispersion among smaller trans-

actions is akin to a set of investors, such as retail investors, with varying access to pricing information.

I estimate regressions at the individual bond level, measuring the sale of investment grade municipal bonds to retail investors with *ParSale*, equal to the net par sold to retail investors, and *NumSale*, equal to the net number of sales to retail investors. I include two sets of explanatory variables in the regression. Similar to the difference-in-difference-in-differences empirical methodology, the first set of explanatory variables controls for the time period of the bond offering date (either before the court decision or after the temporary rule adoption), the classifications of firms engaging in customer sales (either BA or B), and the state classification relating to the bond (either non-fiduciary or fiduciary). The variables include

- $I^{TR}$  - an indicator variable equal to 1 if the offering date of the bond is after the temporary rule adoption, and 0 if the offering date of the bond is before the court decision
- $\overline{I^{BA}}$  - a continuous variable with a range between 0 and 1 equal to the average of  $I^{BA}$  (an indicator variable equal to 1 if a BA firm engages in the bond sale, and 0 if a B firm engages in the bond sale) for all firms engaging in at least one customer sale regardless of par amount<sup>23</sup>
- $I^{NF}$  - an indicator variable equal to 1 if the bond relates to a non-fiduciary state, and 0 if the bond relates to a fiduciary state
- interaction terms between  $I^{TR}$ ,  $\overline{I^{BA}}$ , and  $I^{NF}$  -  $I^{TR} \times \overline{I^{BA}}$ ,  $I^{TR} \times I^{NF}$ ,  $\overline{I^{BA}} \times I^{NF}$ , and  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$

---

<sup>23</sup>I weight the average with the total par amount of firm customer sales. I average  $I^{BA}$  using all firms engaging in at least one customer sale regardless of transaction size instead of firms engaging in at least one retail sale to measure the classifications of firms that could have engaged in a retail sale.  $\overline{I^{BA}}$  is undefined for bonds with no customer sales. These bonds are therefore not in the regression sample.

The second set of explanatory variables controls for differences between firms, bonds, and states that could also be important in explaining retail sales. The potential amount of bond sales to retail investors should relate to the trading activity of the firms engaging in customer sales. I control for firm trading activity with a quarterly measure of net firm customer sales ( $CSales$ ) averaged at the bond level similar to  $\overline{I^{BA}}$  ( $\overline{CSales}$ ). I also control for differences between bonds by including variables describing the total par offering amount ( $TotPar$ ), bond maturity ( $Maturity$ ), and other bond characteristics (see Appendix A.2).

Assuming that retail investors purchase the bonds of within-state municipalities, economic differences between states could also be important in explaining retail sales. I control for differences in income distributions with annual median income ( $StateMedInc$ ) and annual income standard error ( $StateIncSE$ ). I also control for differences in investor demand ( $StateDmnd$ ) equal to the natural log of the product of state GDP and the maximum of personal, corporate, and bank state tax rates (Harris and Piwowar; 2006). Lastly I include aggregate state level total par offering amount ( $StateTotPar$ ) to control for recent bond issuance activity.

I rescale  $ParSale$ ,  $\overline{CSales}$ ,  $TotPar$ ,  $StateMedInc$ ,  $StateIncSE$ , and  $StateTotPar$ , by dividing each variable by 10,000 and then taking the natural log of one plus the scaled value. I also rescale  $NumSale$  and  $Maturity$  by taking the natural log of one plus its value. I lag  $\overline{CSales}$ ,  $TotPar$ ,  $StateTotPar$ ,  $StateMedInc$ ,  $StateIncSE$ , and  $StateDmnd$  to the quarter or year prior to the bond offering date. In equation form, I estimate the following regression

$$\begin{aligned}
Y_i = & \beta_0 + \beta_1 I_i^{TR} + \beta_2 \overline{I_i^{BA}} + \beta_3 \left( I_i^{TR} \times \overline{I_i^{BA}} \right) \\
& + \beta_4 I_i^{NF} + \beta_5 \left( I_i^{TR} \times I_i^{NF} \right) + \beta_6 \left( \overline{I_i^{BA}} \times I_i^{NF} \right) \\
& + \beta_7 \left( I_i^{TR} \times \overline{I_i^{BA}} \times I_i^{NF} \right) + \boldsymbol{\beta} \mathbf{X}_i + \varepsilon_i
\end{aligned} \tag{1}$$

where  $Y$  represents either  $ParSale$  or  $NumSale$ ,  $\beta$  represents model parameters,  $\mathbf{X}$  represents

the set of additional control variables,  $\varepsilon$  represents model error, and  $i$  indexes bonds.<sup>24</sup> I estimate both regressions using a tobit model that specifies censored observations at 0. I exclude individual bond observations with net par sold or net number of sales less than 0. With these observations, I am likely either missing transactions as a result of excluding firms not meeting sample requirements or miscategorizing transactions as relating to either retail or institutional customers.<sup>25</sup> I calculate  $t$ -statistics with standard errors clustered at the 6-digit cusip level to account for correlations in the error term at the level of the municipality. There are 157,116 observations relating to individual bonds in the regressions describing net sales less than or equal to \$50,000, and there are 157,979 observations relating to individual bonds in the regressions describing net sales less than or equal to \$20,000.

Two of the explanatory variables are of particular interest. The first variable of interest,  $I^{TR} \times \overline{I^{BA}}$ , controls for the change in retail sales following the temporary rule adoption in fiduciary states (setting  $I^{NF}$  equal to 0) dependent on the classification of firms engaging in bond customer sales. A significant regression parameter estimate corresponding to this variable indicates that the retail sale of a bond following the temporary rule adoption is dependent on the classifications of firms engaging in customer sales, and suggests that the temporary rule or the investment adviser regulatory regime, but not a fiduciary standard of conduct, may influence security recommendations.

The second variable of interest,  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$ , controls for the additional change in retail sales following the temporary rule adoption in non-fiduciary states (setting  $I^{NF}$  equal to 1) dependent on the classification of firms engaging in customer sales. A significant regression parameter estimate corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  indicates that there is an additional effect following the temporary rule adoption in the relationship between retail sales and the classifications of firms engaging in customer sales in non-fiduciary states, and

---

<sup>24</sup>I also include state fixed effects in an alternative regression specification. I find little difference in the results.

<sup>25</sup>I exclude 3,444 observations with either negative net retail or institutional sales (see Section IV.c) when the retail transaction threshold is set at \$50,000, and I exclude 2,473 observations with either negative net retail or institutional sales when the retail transaction threshold is set at \$20,000.

suggests that a fiduciary standard of conduct may influence security recommendations.

#### IV.b *Results*

Table 3a presents model estimates for regression equation (1) when the retail transaction threshold is set at \$50,000, and Table 3b presents model estimates for regression equation (1) when the retail transaction threshold is set at \$20,000. I find that the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}}$  are insignificant in all regressions, whereas the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  are positive and significant at the 95% confidence level in all regressions. The sign and significance of the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  indicate an additional increase in retail sales by BA firms relative to B firms in non-fiduciary states following the temporary rule adoption, and suggests that a fiduciary standard of conduct may relate to the retail sale of investment grade municipal bonds. The insignificance of the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}}$  indicate that I do not find evidence in this empirical setting that the temporary rule or other aspects of the investment adviser regulatory regime may also explain retail sales following the rule adoption.

Among the other control variables, I find that average firm customer sales, bond total par offering amount, and bond maturity are positive and significant determinants of retail sales, whereas other bond characteristics including sinking fund provisions, odd interest payment frequency, and federal and state taxes are negative and significant. In general, the sign and significance of the bond characteristic variables reflects the inclination of financial agents to avoid recommending and selling municipal bonds to retail investors with disadvantageous or complex features. I also find that state median income and investor demand are also positive and significant determinants of retail sales.

I estimate the possible economic significance of a fiduciary standard of conduct by subtracting the change in the unconditional expected value of *ParSale* and *NumSale* for a bond sold entirely by BA firms in non-fiduciary states with (a) the same change for a bond sold entirely by B firms in non-fiduciary states, and with (b) the same change for a bond sold

entirely by BA firms in fiduciary states. I calculate the unconditional expected amount of retail sales for a bond sold either entirely by BA firms or by B firms to obtain the most direct comparison between firm and state classifications as possible. In equation form, I estimate

$$\underbrace{(E[Y_{1,1,1}] - E[Y_{0,1,1}])}_{\Delta \text{ BA/non-fiduciary}} - \underbrace{(E[Y_{1,0,1}] - E[Y_{0,0,1}])}_{\Delta \text{ B/non-fiduciary}} - \underbrace{(E[Y_{1,1,0}] - E[Y_{0,1,0}])}_{\Delta \text{ BA/fiduciary}}$$

where  $Y$  represents either *ParSale* or *NumSale*, the first subindex of  $Y$  represents the value of  $I^{TR}$ , the second subindex of  $Y$  represents the value of  $\overline{I}^{BA}$ , and the third subindex of  $Y$  represents the value of  $I^{NF}$ . The first comparison, retail sales relating to B firms in non-fiduciary states, accounts for the change in expected retail sales in non-fiduciary states, and the second comparison, retail sales relating to BA firms in fiduciary states, accounts for the change in expected retail sales by BA firms. Neither comparison accounts for the change in bond sales as a result of an introduction of a fiduciary standard of conduct, such as with BA firms in non-fiduciary states, to a portion of security recommendations that would otherwise have not been subject to such a standard. The full difference, therefore, measures the potential effect of a fiduciary standard of conduct to the recommendation and sale of investment grade municipal bonds. To obtain a relative measure, I benchmark the full difference to the unconditional expected value of the dependent variables for a bond sold entirely by BA firms in non-fiduciary states prior to the court decision ( $E[Y_{0,1,1}]$ ).

Table 4 presents the estimates of economic significance. When the retail transaction threshold is set at \$50,000, I find that a fiduciary standard of conduct may lead to an 8.3% increase in *ParSale* and a 9.2% increase in *NumSale* per bond, and when the retail transaction threshold is set at \$20,000, I find that a fiduciary standard of conduct may lead to a 16.4% increase in *ParSale* and a 16.0% increase in *NumSale* per bond. The influence of a fiduciary standard of conduct on security recommendations does not necessarily imply that the recommendations are necessarily “better,” but does imply that the recommendations are different. For example, there is a trade-off between having securities in brokerage accounts

where generally the financial agent has no continuing obligation after providing investment advice but also does not charge ongoing fees, and having securities in advisory accounts where more typically the financial agent has agreed to a continuing obligation after providing investment advice but charges fees based on assets under management.<sup>26</sup> The decision to have long term assets in advisory accounts instead of brokerage accounts may therefore prove to be more costly in the long run.

#### *IV.c Extensions*

The time period of the study overlaps events relating to the recent financial crisis which may also have had an effect on the recommendation and sale of investment grade municipal bonds. For instance, bonds with offering dates from July 2008 to September 2008 have 60 trading day windows that overlap the bankruptcy of Lehman Brothers in September 2008. To investigate whether other events may have also led to a change in retail sales following the temporary rule adoption, I partition the full regression sample into calendar quarters and reestimate regression equation (1). That is, I reestimate regression equation (1) using bonds with offering dates either in the fourth quarter of 2006 and in the fourth quarter of 2007 (the first quarter following the temporary rule adoption), in the first quarter of 2006 and in the first quarter of 2008, in the second quarter of 2006 and in the second quarter of 2008, or in the third quarter of 2006 and the third quarter of 2008 (the fourth quarter following the temporary rule adoption). I partition the regression sample by calendar quarter to control for the effect of seasonal trends. If the results in the first set of tests relate to the adoption of the temporary rule, then I should find similar evidence either soon after the temporary rule adoption or throughout the post-event time period.

Table 5a presents the abbreviated regression results when the retail transaction threshold is set at \$50,000, and Table 5b presents the abbreviated regression results when the retail

---

<sup>26</sup>Whether a broker-dealer or investment adviser has continuing obligations is dependent on the contractual arrangement with the customer. Over 95% of investment advisers charge fees based on the percentage of assets under management and less than 10% of investment advisers charge transaction based compensation (SEC; 2011).

transaction threshold is set at \$20,000. I find that the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  are positive and statistically significant in the regressions describing the retail sale of bonds with offering dates in the first quarter and in the second quarter following the temporary rule adoption, and are insignificant in the regressions describing the retail sale of bonds with offering dates in the third quarter and in the fourth quarter. These results indicate that if a fiduciary standard of conduct was significant in resulting in additional investment grade municipal bond retail sales, then it was most significant shortly after the rule adoption and before the potential influence of other events. I also only find strong evidence that  $I^{TR} \times \overline{I^{BA}}$  is statistically significant in the regressions describing retail sales of bonds with offering dates in the second quarter. Thus, I do not find evidence of a trend that could relate to the temporary rule or other aspects of the investment adviser regulatory regime.

As a comparison to retail sales, I reestimate regression equation (1) but instead model institutional sales. I define a customer transaction as an “institutional transaction” if the par amount is strictly greater than \$50,000. The additional increase in retail sales by BA firms relative to B firms in non-fiduciary states following the temporary rule adoption could be the result of a relative overall increase in the sale of these securities by BA firms and may not pertain specifically to retail investors. I reestimate regression equation (1) using the full regression sample and the regression sample partitioned by calendar quarter.

Table 6 presents the regression results when I use the full regression sample. I find that the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}}$  are positive and statistically significant in both regressions, and that only in the regression describing *ParSale* is the parameter estimate corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  statistically significant albeit negative. These results suggest that although there was an increase in institutional sales by BA firms relative to B firms following the temporary rule adoption, the change in institutional sales dependent on the classification of firms engaging in customer sales was more positive for bonds relating to fiduciary states than to non-fiduciary states. Although a relationship potentially exists

between retail and institutional sales, these results suggest that the relative increase in retail sales by BA firms in non-fiduciary states is not reflective of an overall trend relating to these firms and securities. Table 7 presents the abbreviated regression results when I separate bond observations by calendar quarter. Similar to the quarterly regressions describing retail sales, and further evidence of a potential relationship between retail and institutional sales, I find that parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}}$  and  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  are significant in the regressions describing the institutional sale of bonds with offering dates in the first quarter and in the second quarter following the temporary rule adoption, and insignificant in the regressions describing the institutional sale of bonds with offering dates in the third quarter and in the fourth quarter.

## V. Tests of Retail Transaction Cost

### V.a *Empirical Model*

In the second set of tests, I investigate the effect of regulatory regimes on the transaction cost of investment grade municipal bonds. I utilize the Harris and Piwowar (2006) methodology to measure transaction cost.<sup>27</sup> The model describes bond price as a function of bond value, transaction cost, and interdealer price concession. The authors model transaction cost as a three term function. From this cost function, I obtain estimates of transaction cost at the individual bond level for transactions of par value equal to \$20,000, \$50,000, \$100,000, and \$1,000,000. Cost estimates of transactions of par value equal to \$20,000 and \$50,000 relate more to the cost of retail transactions, and cost estimates of transactions of par value equal to \$100,000 and \$1,000,000 relate more to the cost of institutional transactions.

To investigate the effect of regulatory regimes on transaction cost, I regress estimates of transaction cost on variables controlling for firm classification, the time period of the bond offering, the state classification relating to the bond, and other potential determinants of transaction cost including bond characteristics and state level variables. The additional variables in the cost function are similar to the explanatory variables that I use to explain

---

<sup>27</sup>See Appendix A.3 for a description of the methodology.

customer sales in Section IV. However, I respecify  $\overline{I^{BA}}$  and  $\overline{CSales}$  to take into consideration the utilization of each customer transaction to estimate transaction cost. I now define the variable  $\overline{I^{BA}}$  as the non-weighted average of  $I^{BA}$  of all customer transactions, both purchases and sales, and  $\overline{CSales}$  as the non-weighted average of the aggregate par amount of all firm customer transactions ( $\overline{CTrans}$ ). I estimate the following regression

$$\begin{aligned} \widehat{C}_{S,i} = & \beta_0 + \beta_1 I_i^{TR} + \beta_2 \overline{I_i^{BA}} + \beta_3 \left( I_i^{TR} \times \overline{I_i^{BA}} \right) \\ & + \beta_4 I_i^{NF} + \beta_5 \left( I_i^{TR} \times I_i^{NF} \right) + \beta_6 \left( \overline{I_i^{BA}} \times I_i^{NF} \right) \\ & + \beta_7 \left( I_i^{TR} \times \overline{I_i^{BA}} \times I_i^{NF} \right) + \beta \mathbf{X}_i + \varepsilon_i \end{aligned} \quad (2)$$

where  $\widehat{C}$  represents cost estimates and  $S$  represents transaction size.<sup>28</sup> I incorporate the Bayesian shrinkage estimator of Harris and Piwovar (2006) to calculate the variance of cost estimates, and weight regression observations with the inverse of the variances. I calculate  $t$ -statistics with standard errors clustered at the 6-digit cusip level to account for correlations in the error term at the level of the municipality. There are 57,540 individual bonds that meet the requirements of the Harris and Piwovar (2006) model, and 57,500 observations relating to individual bonds that are in the regression sample.

Similar to the regressions in Section IV, the two variables of interest are  $I^{TR} \times \overline{I^{BA}}$  and  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$ . A significant regression parameter estimate corresponding to  $I^{TR} \times \overline{I^{BA}}$  indicates a change in transaction cost following the temporary rule adoption in fiduciary states dependent on the classification of firms engaging in bond customer transactions. Significance of this variable suggests, especially for estimates of retail transaction cost, that the costs relating to compliance of the temporary rule may have resulted in an increase in the cost of BA firm transactions. A significant regression parameter corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  indicates an additional change in transaction cost in non-fiduciary states following the temporary rule adoption dependent on the classification of firms engaging in

---

<sup>28</sup>I also include state fixed effects in an alternative regression specification. I find little difference in the results.

bond customer transactions. The results in the first set of tests indicate an additional increase in retail sales by BA firms relative to B firms in non-fiduciary states. It is possible that this additional increase in retail sales is also contemporaneous with a change in retail transaction cost.

## V.b *Results*

Similar to Harris and Piwowar (2006), I find that customer transaction cost decreases as transaction size increases. For example, average transaction cost weighted by the inverse of cost estimate variance ranges from 87 basis points for transactions of \$20,000, to 77 basis points for transactions of \$50,000, to 63 basis points for transactions of \$100,000, and to 21 basis points for transactions of \$1,000,000. These estimates are similar to Harris and Piwowar (2006) who find that average customer transaction cost ranges from 99 basis points for transactions of \$20,000, to 77 basis points for transactions of \$50,000, to 62 basis points for transactions of \$100,000, and to 24 basis points for transactions of \$1,000,000.

Table 8a presents model estimates for regression equation (2) describing the cost of transactions of par value equal to \$20,000 and \$50,000, and Table 8b presents model estimates for regression equation (2) describing the cost of transactions of par value equal to \$100,000 and \$1,000,000. I find that  $I^{TR} \times \overline{I^{BA}}$  is a positive and significant determinant of transaction cost in all four regressions, and that  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  is a negative and significant determinant in regressions describing the cost of transactions of par value equal to \$20,000, \$50,000, and \$100,000. The significance and similar magnitude of parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}}$  in all four regressions suggests that the additional change in transaction cost dependent on the classification of firms engaging in customer transactions may not relate to the temporary rule but instead to other factors that would have a more systematic effect on the cost of all transactions regardless of size. The sign and significance of the parameter estimates corresponding to  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  indicate an additional decrease in retail transaction cost for those bonds relating to non-fiduciary states and with a greater proportion of transactions by BA firms. Although this additional decrease is greater for transactions relat-

ing more to retail investors, the tests below indicate that it may not relate to the additional increase in retail sales found in Section IV.

Among the other control variables, bond characteristics that are positive and significant determinants of retail transaction cost include bond maturity, optional call schedules, odd interest payment frequency, and state median income. Credit enhancements are also positively and significantly related to retail transaction cost, but more so prior to the temporary rule adoption than after; although the credit enhancement indicator variable is positive and statistically significant, the interaction term between the credit enhancement indicator variable and  $I^{TR}$  is negative and statistically significant. Retail transaction cost is also lower for bonds with total par offering amount. The sign and significance of many of the control variables are similar to the findings of Harris and Piwowar (2006).

### *V.c Extension*

To investigate whether other events could relate to the changes in transaction cost following the temporary rule adoption, I again partition the full regression sample into calendar quarters and reestimate regression equation (2). In each one of the regressions, the variables of interest are again  $I^{TR} \times \overline{I^{BA}}$  and  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$ .

Table 9a presents the abbreviated regression results describing the cost of transactions of par value equal to \$20,000 and \$50,000, and Table 9b presents the abbreviated regression results describing the cost of transactions of par value equal to \$100,000 and \$1,000,000. I find that  $I^{TR} \times \overline{I^{BA}}$  is positive in all regressions, and significant in at least one regression relating to each transaction size and quarter. On the other hand, I find that  $I^{TR} \times \overline{I^{BA}} \times I^{NF}$  is negative and statistically significant in the regressions describing the transaction cost of bonds with offering dates in the second quarter and in the third quarter following the temporary rule adoption. This result indicates that the time periods in which I find an additional decrease in retail transaction cost by BA firms relative to B firms in non-fiduciary states only partially overlaps the time periods in which I find an additional increase in retail sales. These two results, therefore, may not be related. Taken together, I do not find

enough evidence to conclude that changes to the regulatory regime governing the principal transactions of investment grade municipal bonds relate to changes in transaction cost that is specific to retail investors.

## VI. Conclusion

This paper is a first step in determining the importance of regulatory regimes to the provision of personalized investment advice about securities to retail investors. Broker-dealers and investment advisers may provide many of the same services yet are subject to two different legal frameworks. The results in this paper indicate that differences between the two regulatory regimes may be important to the advice retail investors receive.

This paper investigates just one aspect of the many services broker-dealers and investment advisers may provide. Although I utilize transaction level data, regulatory events, and additional information like state laws, the lack of account level information limits the efficacy of the empirical methodology. Both regulators and researchers would greatly benefit from information describing investor demographics, account characteristics, the types of security investments, and security returns. Such information can not only provide a more meaningful description of a market characterized by information asymmetries, but also an industry that is vital to the financial well-being of many retail investors.

# Appendix

## A.1 *MSRB RTRS Dataset*

There are 35,169,982 transaction observations in the MSRB dataset from July 2005 to December 2008.<sup>29</sup> The dataset reduces to 11,065,403 observations after I exclude bonds with missing issuance or bond information on Mergent, and bonds not meeting sample requirements (see Section II.b), and further reduces to 6,046,632 observations after I exclude transactions with missing trade date, time of trade, transaction price, and par amount information; inaccurate trade date information; and transactions with trade dates not within 60 trading days of the bond offering date.

I also exclude managed account transactions, or where an intermediary acts on the behalf of multiple customers and allocates securities across accounts. These transactions may appear in the dataset as a contemporaneous purchase and then sale to multiple customers at the same time and price with equal par amounts. There are 5,993,465 observations after combining multiple transactions with these similarities to one.

I identify observations with inaccurate transaction prices by comparing the price of an observation to the offering price of the bond and the prices of transactions that immediately precede and follow the observation. For each comparison price (relating to the offering price, the transaction price immediately preceding the observation, and the transaction price immediately following the observation), I calculate a measure equal to the absolute value of the observation price minus the comparison price, all divided by the observation price. I then separately rank each one the three sets of comparison measures. I classify a price as inaccurate with respect to one of the three comparison prices if it ranks in the top 0.05%. I choose 0.05% by examining outliers in the remaining sample when the threshold ranges from 0.01% to 0.1%.

---

<sup>29</sup>After August 2007, the original dataset separates each interdealer transaction into two observations. However, the original dataset also contains a field assigning each interdealer transaction an identification code. I use the identification code to combine the duplicate interdealer transactions. If I cannot match interdealer transactions on identification code, then I match on trade information. I assume the remaining interdealer transactions are non-duplicative.

I delete all individual observations from the sample where each one of the three comparison measures classify as inaccurate and the prices of the transactions immediately following and preceding the observation are also not inaccurate with respect to the next closest transaction. I also exclude all observations relating to a particular bond if an individual observation is inaccurate with respect to the offering price but I cannot delete it from the sample. This can occur when bond prices are inaccurate with respect to the offering price in consecutive transactions. I exclude 5,911 observations from the sample using this methodology, and I also exclude an additional 40,487 observations with bond price less than or equal to 0.01.

I also clean the dataset using par value traded information. I exclude observations with par value traded greater than total par offering amount. I also identify duplicate observations in the dataset by aggregating the par value traded to customers. I consider identical observations to be duplicate if the total par value sold to customer accounts is greater than the total par offering amount by the par value traded. I exclude 369 transactions that are duplicate and 2,209 observations with par traded greater than total par offering amount. Past researchers have taken additional steps to refine the MSRB transaction dataset. The additional refinements, however, impose additional assumptions on the dataset. There are 5,944,489 observations before excluding additional observations relating to agency transactions, and bonds that are not investment grade from the final sample.

## *A.2 Bond Characteristic Variables*

The following is a list of bond characteristic indicator variables that I use in the regressions as explanatory variables. I define each variable with information from the Mergent dataset.

- *AAA* - equal to 1 if the bond has an investment grade rating of AAA, 0 otherwise
- *OptCallSched* - equal to 1 if the bond has an optional call schedule, 0 otherwise
- *ExtraOrdCall* - equal to 1 if the bond issue is subject to an extraordinary call, 0 otherwise

- *PutOption* - equal to 1 if the bond has a put option, 0 otherwise
- *CredEnh* - equal to 1 if the bond has either additional credit or bond insurance, 0 otherwise
- *SinkFund* - equal to 1 if the bond has a sinking fund provision, 0 otherwise
- *OddIntFreq* - equal to 1 if the frequency of interest payments is not semi-annual, 0 otherwise
- *OddIntCalc* - equal to 1 if the interest calculation is not 30 days per month by 360 days per year, 0 otherwise
- *GenObl* - equal to 1 if the security is a general obligation bond, 0 otherwise
- *RevBond* - equal to 1 if the security is a revenue bond, 0 otherwise
- *GenPurp* - equal to 1 if the security is for general purpose or public improvement, 0 otherwise
- *Education* - equal to 1 if the use of proceeds relates to higher education, primary and secondary education, and other education; 0 otherwise
- *Utility* - equal to 1 if the use of proceeds relates to public utilities including power, gas telephone, water, and waste; 0 otherwise
- *Health* - equal to 1 if the use of proceeds relates to hospitals, nursing homes, and other healthcare; 0 otherwise
- *CertPart* - equal to 1 if the type of debt is a certificate of participation, 0 otherwise
- *FedTax* - equal to 1 if the maturity is taxable at the federal level, 0 otherwise
- *StateTax* - equal to 1 if the maturity is taxable by the state of issue, 0 otherwise

I also include an interaction term between *CredEnh* and  $I^{TR}$  ( $CredEnh \times I^{TR}$ ) to control for the potential change to the influence of credit enhancements on bond transactions as a result of the financial crisis.

### A.3 *Harris and Piwowar (2006) Methodology*

I follow Harris and Piwowar (2006) and model bond price  $P$  as a function of bond value  $V$ , investor transaction cost  $C$ , and interdealer price concession  $\delta$ . Transaction cost is dependent on whether the bond transaction is a dealer sale to a customer, a dealer purchase from a customer, or an interdealer transaction. To incorporate differences in transaction type, investor transaction cost is interacted with variable  $Q$ , equal to 1 if the transaction is a dealer sale to a customer, equal to -1 if the transaction is a dealer purchase from a customer, and equal to 0 if the transaction is an interdealer trade. Interdealer price concession  $\delta$  is interacted with an indicator variable  $I^D$ , equal to 1 if the trade is an interdealer trade, and equal to 0 otherwise. In equation form, the price for bond  $i$  at time  $t$  is

$$P_{it} = V_{it} + Q_{it}P_{it}C_{it} + I_{it}^D P_{it}\delta_{it}$$

After taking the natural log of both sides of the bond price equation, the price equation for bond  $i$  at time  $t$  is subtracted from the price equation for bond  $i$  at time  $s$ . Following the approximations made by Harris and Piwowar (2006), the equation for the difference in bond price from time  $s$  to time  $t$  is

$$r_{its}^P = r_{ts}^V + Q_{it}C_{it} - Q_{is}C_{is} + I_{it}^D\delta_{it} - I_{is}^D\delta_{is}$$

where  $r^P$  represents the difference in the natural log of bond price and  $r^V$  represents the difference in the natural log of bond value. I define time  $s$  using the most recent bond trade, either customer or interdealer, prior to the trade at time  $t$ . If more than one bond transaction occurs at time  $s$ , then I use the bond transaction with greatest par value to calculate returns for transactions that occur at time  $t$ . Large transactions, typically involving institutional investors, are likely to provide more information than small transactions, possibly involving

retail investors. If more than one transaction occurs at time  $t$ , then time  $s$  is equal to time  $t$ . In this instance, I use the transaction with the greatest par amount to calculate differences in the natural log of bond price.

Harris and Piwovar (2006) model the difference in the natural log of bond value between the two trades as

$$r_{its}^V = N_{ts}^{CalDay}(5\% - Coupon_i) + \beta_1^V AvgSL_{ts} + \beta_2^V DiffSL_{ts} + \gamma_{its}$$

where  $N_{ts}^{CalDay}$  represents the number of calendar days between time  $s$  and time  $t$ ,  $(5\% - Coupon)$  represents the difference between the bond's coupon interest rate and 5%,  $AvgSL$  represents the average in and  $DiffSL$  represents the difference between short-term and long-term index returns, and  $\gamma$  is model error. The difference between the bond's coupon rate and 5%, in units of one calendar day, measures the return a trader would expect between trade dates when interest rates are constant. The expression of all bond returns in this manner, including when calculating bond index returns, should not affect the results. The error term  $\gamma$  has mean zero and variance equal to  $N_{ts}^{TrdSes} \sigma_{TrdSes}^2$  where  $N_{ts}^{TrdSes}$  represents the number of trading sessions from time  $s$  to time  $t$ . I estimate index returns using a repeat sales regression methodology (Case and Shiller; 1987).<sup>30</sup>

Harris and Piwovar (2006) model transaction cost as a three or four term function. The primary cost function in their analysis is

$$C_i = c_0 + c_1 S_i^{-1} + c_2 \ln S_i + \kappa_i$$

where  $c_0$ ,  $c_1$ , and  $c_2$  represent model parameters;  $S$  represents transaction size; and  $\kappa$  represents model error. They motivate the equation as one part that controls for cost as a proportion of transaction size ( $c_0$ ), one part that controls for fixed costs per trade, ( $c_1 S^{-1}$ ), and one part that controls for cost as it varies with transaction size ( $c_2 \ln S$ ).

The bond price equation is modeled separately for each bond. The full bond price

---

<sup>30</sup>See Appendix A.4 for a full explanation of the repeat sales regression methodology.

equation is

$$r_{its}^P - N_{ts}^{CalDay}(5\% - Coupon_i) = \beta_1^V AvgSL_{ts} + \beta_2^V DiffSL_{ts} + Q_{it} C_{it} - Q_{is} C_{is} + \eta_{its} \quad (3)$$

where  $\eta$  represents model error. The error term  $\eta$  can be expressed as

$$\eta_{its} = \gamma_{its} + I_{it}^D \delta_{it} - I_{is}^D \delta_{is} + Q_{it} \kappa'_{it} - Q_{is} \kappa'_{is}$$

with zero mean and variance,  $\sigma_\eta^2$ , that can be expressed as

$$\sigma_\eta^2 = N^{TrdSes} \sigma_{TrdSes}^2 + D_{ts} \sigma_\delta^2 + (2 - D_{ts}) \sigma_\kappa^2$$

where  $D_{ts}$  is equal to the number of interdealer transactions between each of the two trades (0, 1 or 2),  $\sigma_\delta^2$  represents the variance of  $\delta$ , and  $\sigma_\kappa^2$  represents the variance of  $\kappa$ .

I follow Harris and Piwowar (2006) and use an iterated least squares methodology to estimate parameter estimates of equation (3) with weights equal to the inverse of  $\sigma_\eta^2$  estimates. Estimates of  $\sigma_\eta^2$  are obtained by pooling error terms from equation (3) and regressing the square of these error terms on  $N^{TrdSes}$ ,  $D_{ts}$ , and  $(2 - D_{ts})$ . The parameters multiplying  $N^{TrdSes}$ ,  $D_{ts}$ , and  $(2 - D_{ts})$  are constrained to be strictly greater than zero.

#### A.4 Repeat-Sale Regression

I calculate short-term and long-term bond daily index returns using the repeat-sale regression method of Case and Shiller (1987), regressing the returns of short-term bonds or long-term bonds on a set of indicator variables representing trade dates. I define bonds as short-term if less than 60 months remain until maturity, and bonds as long-term if at least 144 months remain until maturity. The indicator variables,  $I^{td}$ , are equal to 1 if the bond is held or sold on the trade date, 0 otherwise. The repeat-sale regression in equation form for all trades from the beginning of the sample period ( $\tau = 1$ ) to the end of the sample period ( $\tau = T$ ) is

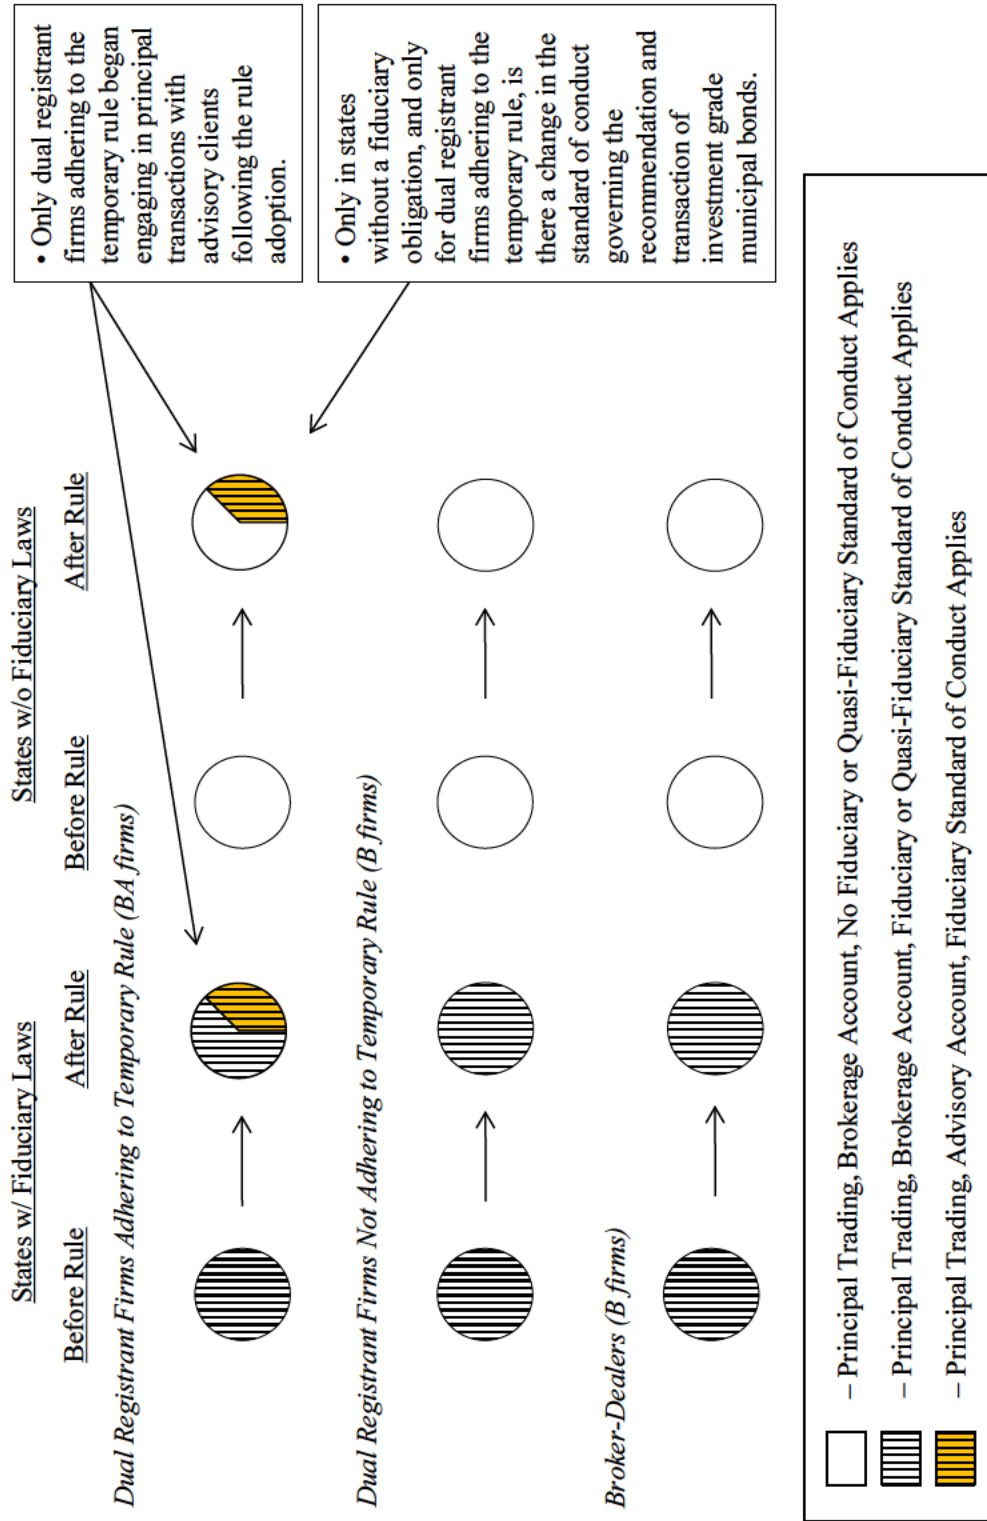

$$r_{its} - N_{ts}^{CalDay}(5\% - Coupon_i) = \sum_{1 \leq \tau \leq T} \beta_\tau I_\tau^{td} + \zeta_{its} \quad (4)$$

where  $r_{its}$  represents the difference in the natural log of the price of bond  $i$  between time  $s$  and time  $t$ ,  $N_{ts}^{CalDay}$  represents the number of calendar days between time  $s$  and time  $t$ , and  $(5\%-Coupon)$  is the difference between the bond's coupon interest rate and 5% in units of one calendar day.

I obtain parameter estimates for both short-term and long-term bonds using a three-step procedure beginning with an initial estimate of equation (4). I then regress the initial squared estimates of  $\zeta$  on the total number of days between consecutive trades, the squared total number of days between trade dates, and an intercept. Lastly, I reestimate equation (4) using fitted values from the second stage as regression weights. I use interdealer transactions only in the repeat-sale regression to avoid noise from the bond prices of customer transactions. If more than one interdealer transaction occurs for the same bond on a given trade date, then I use the last interdealer transaction on that date.

**Figure 1: Changes to the Regulatory Regime Governing the Principal Transactions of Investment Grade Municipal Bonds by Firm and State Classification**

This figure describes the change in the regulatory regime governing principal transactions dependent on firm classification and the presence of state fiduciary laws. For simplicity, this figure does not account for changes to the proportion of advisory accounts held at dual registrant firms following the court decision and temporary rule adoption. See Section II for further discussion.

**Table 1: State Classification by Region**

| <b>Region</b> | <b>Non-Fiduciary States</b>                            | <b>N</b> | <b>Fiduciary States</b>                                                                                                                                       | <b>N</b> |

| Number        |                                                        | 14       |                                                                                                                                                               | 37       |

This table lists the states either classifying as a fiduciary state or a non-fiduciary state by region. A fiduciary state requires broker-dealers to operate in a fiduciary or quasi-fiduciary capacity, whereas a non-fiduciary state makes no such requirements. See Sections II.b and III.c for a further description.

**Table 2: Number and Par Value of Customer Transactions**

| Year | All                                         |        | BA      |        | B       |        | All     |        | BA      |        | B       |       |

| 2008 | 376,530                                     | 10.48  | 238,460 | 6.68   | 138,070 | 3.80   | 146,090 | 1.91   | 91,553  | 1.22   | 54,537  | 0.69  |

This table presents the aggregate number and value of all investment grade municipal bond customer principal transactions. Panel A presents information describing all customer sales and purchases, Panel B presents information describing all sales to customers, Panel C presents information describing all sales to customers less than or equal to \$50,000, and Panel D presents information describing all sales to customers less than or equal to \$20,000. The table presents customer transactions for all firms, for dual registrant firms engaging in principal transactions with brokerage and advisory clients after the temporary rule adoption (BA firms), and for firms engaging in principal transactions with brokerage clients only after the temporary rule adoption (B firms). I obtain transaction information from the MSRB RTRS dataset.

This table reports the results from tobit regressions describing the net par amount sold (*ParSale*) and the net number of municipal bond sales (*NumSale*) to retail investors. The regression model is equation (1). Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm sales, bond characteristics, and state level factors. In these tests, I define retail sales as customer sales with par value less than or equal to \$50,000. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section IV for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

**Table 3b: Tobit Regressions Describing Retail Sales ( $\leq$  \$20k)**

|                                                 | <i>ParSale</i>      | <i>NumSale</i> |                             | <i>ParSale</i>      | <i>NumSale</i> |

This table reports estimates of the potential economic significance of a fiduciary standard of conduct. Columns with “ $E[Y]$ ” headers report the unconditional expected value of the dependent variables stemming from the estimation of regression equation (1) given the time period of the retail sales,  $I^{TR}$ , the classification of firms engaging in customer sales,  $I^{BA}$ , and the state classification relating to the bond,  $I^{NF}$ . All other variables are set to its sample mean. The variable  $Y$  represents either *ParSale* or *NumSale*. Columns with “ $\Delta_i$ ” headers report differences between time periods, and the third to last column reports the full difference between all firm and state classifications. I benchmark the full difference with the unconditional expected value of the dependent variables by BA firms in non-fiduciary states prior to temporary rule adoption. The last column relates the full difference to the benchmark. See Section IV for full explanation.

This table reports the abbreviated results from tobit regressions describing the net par amount sold (*ParSale*) and the net number of municipal bond sales (*NumSale*) to retail investors. The regression model is equation (1). I partition the full regression sample by calendar quarter. Q1 - Q4 refer to the first quarter to the fourth quarter following the temporary rule adoption. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm sales, bond characteristics, and state level factors. In these tests, I define retail sales as customer sales with par value less than or equal to \$50,000. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section IV for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

This table reports the results from tobit regressions describing the net par amount sold ( $ParSale$ ) and the net number of municipal bond sales ( $NumSale$ ) to institutional investors. The regression model is equation (1). Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm sales, bond characteristics, and state level factors. In these tests, I define institutional sales as customer sales with par value strictly greater than \$50,000. Standard errors are clustered at the 6-digit cusip level, and  $t$ -statistics are located to the right of parameter estimates in parentheses. See Section IV for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

This table reports the abbreviated results from tobit regressions describing the net par amount sold (*ParSale*) and the net number of municipal bond sales (*NumSale*) to institutional investors. The regression model is equation (1). I partition the full regression sample by calendar quarter. Q1 - Q4 refer to the first quarter to the fourth quarter following the temporary rule adoption. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm sales, bond characteristics, and state level factors. In these tests, I define institutional sales as customer sales with par value strictly greater than \$50,000. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section IV for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

| <i>GenObl</i>                                   | -0.0004 <sup>a</sup> | (3.53)  | -0.0004 <sup>a</sup> | (4.43)  |                           |                      |        |                      |         |

This table reports the results from weighted regressions describing the cost of transactions of par value equal to \$20,000 and \$50,000. The regression model is equation (2). I weight observations with the inverse with transaction cost estimate variance. I follow the Harris and Piwovar (2006) methodology. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm transactions, bond characteristics, and state level factors. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section V for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

**Table 9a: Regressions Describing Transaction Cost by Calendar Quarter**

This table reports the results from weighted regressions describing the cost of transactions of par value equal to \$20,000 and \$50,000. The regression model is equation (2). I partition the full regression sample by calendar quarter. Q1 - Q4 refer to the first quarter to the fourth quarter following the temporary rule adoption. I weight observations with the inverse with transaction cost estimate variance. I follow the Harris and Pivovarov (2006) methodology. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm transactions, bond characteristics, and state level factors. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section V for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

This table reports the results from weighted regressions describing the cost of transactions of par value equal to \$100,000 and \$1,000,000. The regression model is equation (2). I partition the full regression sample by calendar quarter. Q1 - Q4 refer to the first quarter to the fourth quarter following the temporary rule adoption. I weight observations with the inverse with transaction cost estimate variance. I follow the Harris and Pivovar (2006) methodology. Independent variables include measures describing the time period of the retail sales ( $I^{TR}$ ), the proportion of bond sales to retail investors by BA firms ( $\overline{I^{BA}}$ ), the state classification relating to the bond ( $I^{NF}$ ), interaction terms between these three variables, the amount of firm transactions, bond characteristics, and state level factors. Standard errors are clustered at the 6-digit cusip level, and *t*-statistics are located to the right of parameter estimates in parentheses. See Section V for a full description. I denote significance at the 1% level with a, the 5% level with b, and the 10% level with c.

# Harmonizing the Regulation of Financial Advisers

July 27, 2012

Copyright © 2012 by Arthur B. Laby

Rutgers University School of Law – Camden

# Dodd-Frank Legislative Reforms

- Consumer Financial Protection Agency
- Regulation of derivatives
- Regulation of executive compensation
- Systemic regulator to manage risk
- Mandatory registration of hedge fund advisers
- Council of regulators
- Heightened consolidated supervision
- *Enhancing investor protection*

# Proposal to Enhance Investor Protection

- Harmonize the law regulating broker-dealers and investment advisers
- Impose a fiduciary duty on brokers who give advice to retail customers

# Brokers-Dealers v. Investment Advisers

- Broker-dealers – dual role
  - Brokers: execute transactions *for* their customers
  - Dealers: execute transactions *with* their customers
  - Provide advice on what securities to buy and sell
  - Charge commissions

# Brokers-Dealers v. Investment Advisers

- Advisers
  - Provide advice
    - Asset allocation
    - Portfolio management
  - No execution (use BD)
  - Restrictions on “dealing”
  - Charge asset-based fees

# Federal Regulation

- Broker-dealers
  - Securities Exchange Act of 1934
  - No uniform fiduciary duty to act in customer's best interest – “suitability” standard
- Investment advisers
  - Investment Advisers Act of 1940
  - Strong federal fiduciary duty to act in client's best interest

# Broker-Dealer Exclusion

- BDs are excluded from IAA under two conditions
  - Advice is “solely incidental” to brokerage
  - Do not charge “special compensation” for advice
- Separation of brokers and advisers worked well
  - Differentiated by compensation
  - Brokers subject to EA and SRO rules under suitability standard
  - Advisers subject to IAA under fiduciary standard
  - Dual registrants: account-by-account regulation

# Changes in the Industry

- May 1, 1975. Elimination of fixed commissions
- Led to advent of discount brokerage
  - Resulted in two-tier pricing – difference in fees may be attributable to advice
  - Resulted in migration to fee-based accounts
- Changes could be *special compensation* abrogating broker-dealer exclusion
- Technology: brokerage commoditized; advice more important relative to execution

# SEC Exemptive Rule

- Broker exclusion from IAA in jeopardy
- Brokers did not want to be subject to IAA
- Sought an exemption from SEC
- SEC complied in 2005: Certain  
BDs Not Deemed IAs
- Brokers would not be considered IAs  
regardless of compensation charged
- Challenged by FPA – FPA prevailed in 2007

# Obama White Paper

- “From the vantage point of the retail customer, an investment adviser and a broker-dealer appear in all respects identical.”
- Legislation should:
  - harmonize the standards
  - impose fiduciary duty on brokers
- Different approach

# Dodd-Frank Act

- Dodd-Frank
  - Required SEC to conduct study on regulatory standards imposed on brokers and advisers
  - Provided rulemaking authority to harmonize duties of brokers and advisers
- SEC Study – January 2011
  - SEC delegated project to SEC staff
  - Concluded SEC should write rules to harmonize duties of brokers and advisers
  - Hot potato: Congress to SEC to Staff, back to SEC

# Recent Developments: Cost-Benefit Analysis

- Commissioners Casey and Paredes criticized study for lack of CBA
- April 2011 – views were validated by *Business Roundtable v. SEC*, overturning proxy access
- SEC Chairman Mary Schapiro announced the staff is preparing a public request for additional data on costs and benefits

# Recent Developments: Retirement Plan Advisers

- DOL has overlapping jurisdiction with SEC as regulator of advice to plans and participants
- Department is attempting to redefine when a service provider becomes a fiduciary
- New definition could cover many brokers and advisers under SEC's jurisdiction
- Different philosophies: SEC often focuses on disclosure; DOL on prohibitions

# Recent Developments: SRO for Advisers

- FINRA acts as an SRO for broker-dealers, not investment advisers
- Many calls for an SRO for advisers over the years – true again today
- Disagreement over both the merits of an SRO for advisers and who it should be
- Important for harmonization: If FINRA is SRO for advisers, FINRA will help administer the fiduciary standard

---

Hi Matt:

In response to your request, please find attached an Excel spreadsheet containing the following:

- 1) The top 15 asset managers based on the value of assets under management for 401(k) plans only;
- 2) The top 15 asset managers based on the value of assets under management for all DC plan types.

Hope this helps!

Best,

Chris

Mark, Keith and Susan,

We would like to schedule an exploratory conversation to gauge SEC staff reaction concerning a condition requiring new public disclosures in two prohibited transaction class exemptions, which will be proposed/amended in conjunction with the reproposal of the investment advice fiduciary regulation.

I anticipate that staff from EBSA's Office of Exemption Determinations would be present to briefly explain the class exemption process and then staff from our Office of Policy and Research (OPR) would take over to provide a more detailed explanation of the public disclosure conditions. Our OPR economists believe that the public disclosure conditions would add transparency to the market for financial advice allowing broker-dealers to be judged based on the rate of return at a particular level of risk-which they achieve for their clients.

Please check with SEC staff that you think is appropriate to attend and suggest some alternative dates/times next week for the call as there will be numerous calendars on both ends to co-ordinate. Our OPR economists have been consulting with Jennifer Marietta-Westberg, PhD in SEC's Division of Risk, Strategy and Financial Innovation on the cost benefit analysis in the fiduciary regulation so she will be invited and the Solicitor's Office has been consulting with its SEC colleagues so they may be invited to attend the meeting too.

Also, should FINRA representatives participate or do you prefer that we contact them separately?

We appreciate your assistance. If you have any questions, please let me know.

Thanks,

Susan

Joseph Piacentini  
Director, Office of Policy and Research  
Employee Benefits Security Administration  
U.S. Department of Labor, Room [REDACTED]  
200 Constitution Ave., NW  
Washington, DC 20210  
Attn: Definition of Fiduciary RIA Data Request

Dear Mr. Piacentini,

Thank you for maintaining an ongoing dialog with the National Association of Insurance and Financial Advisors and other trade associations that represent companies and individuals who would be impacted by a proposed change to the definition of "fiduciary" under ERISA. This letter is response to your letter dated February 10, 2010, requesting by February 17 a listing of which data elements enumerated in the Department of Labor's December 15, 2011 letter we are able to provide, and in what timeframe.

It is important to note that NAIFA represents approximately 200,000 *individuals* who provide a variety of financial services, not businesses, and the nature of our membership significantly impacts the type of information we can provide. NAIFA members are a diverse group of financial professionals who focus their practices on one or more of the following: life insurance and annuities, health insurance, pension plans, employee benefits, multiline insurance, and financial advising and investments.

Virtually all NAIFA members sell life insurance. According to a recent survey of our membership, nearly two-thirds of NAIFA members also are licensed as registered representatives of broker-dealers (RRs) and sell securities to their clients. Of our members who deal in securities, 41% are "dual-registered" as both RRs and as investment advisers (IAs) under the Investment Advisers Act of 1940. The survey also found that, on average, 77% of a NAIFA member's income comes from commissions, 8% from salary, 11% from assets under management and/or planning fees, and only 4% from bonuses and reimbursements.

Dual-registered NAIFA members provide investment guidance under *both* the commission and fee-based compensation models, depending on the preferred compensation arrangements established by mutual agreement with their clients. Generally speaking, these advisors will act as an IA with clients who have significant assets under management, and act as an RR for clients with less in investable assets, for whom fee-based compensation would not be economical. The guidance provided by these advisors is not driven by which compensation arrangement is in place with a particular client. Rather, financial guidance is determined by which investments are most suitable for the

client's current financial situation, needs and goals. It is also critically important to understand that *all* our members are motivated to build long-term relationships of trust with their clients to be a source of ongoing business and referrals.

Because of the nature of our membership, it is not feasible for us to obtain any of the data enumerated in your December 15, 2011 letter. The relationship of our members to their clients and affiliated companies is such that they likely would not have the right to share the client's or company's data even if they have some access to it. NAIFA would, however, be pleased to answer qualitative questions about the diverse ways in which our members serve their clients, and the motivations involved in their relationship-driven business model.

Sincerely,

A handwritten signature in cursive script that reads "Susan B. Waters".

Subject: EBSA Request for Assistance in Obtaining Data Dated December 15, 2011, February 10, 2012

Dear Mr. Piacentini:

Thank you and the other representatives of the Department for taking the time to meet with us and other representatives of the trade associations on January 27, 2012. You answered our questions and clarified certain aspects of the data request.

As we explained, ACLI does not have the account level data that you are seeking. We have asked our members whether they have these data element. While they may have some of the data element, they have few, if any, in electronic format.

We do not think that we can obtain the data you are seeking in the time period that you have suggested. If you have other questions, please contact me.

Thank you for your consideration.

Sincerely,

Attention: Definition of Fiduciary RIA Data Request - Supplemental Response

Dear Mr. Piacentini:

We are responding to your letter dated February 10, 2012, requesting assistance identifying data or data sources “that could help the Department [Employee Benefits Security Administration (“EBSA”)] evaluate the impact, if any, of conflicts of interest faced by brokers or others who advise IRA investors.” This letter supplements our January 13, 2012 response to your 30-day information request of December 15, 2011 and our meeting on January 24, 2012.<sup>1</sup>

Your December 15, 2011 letter asked for comprehensive information about individual IRA accounts and their owners, including detailed data on all the investments held in a particular IRA and their performance over time; the characteristics and transaction history of the IRA account and whether transactions resulted from specific recommendations and whether the recommendations were solicited; and demographics of the IRA holder including his or her risk tolerance, financial literacy and investment strategy preferences. As we stated in our January 13, 2012 written response and at the January 24<sup>th</sup> meeting, the Institute conducts regular research on the 401(k) and IRA markets but does not collect the kind of detailed investment data on returns, investment strategies, advice, trades, and investor characteristics identified by specific individual investors that would allow EBSA to assess the impact of a particular recommendation made to an IRA customer.

---

<sup>1</sup> As you know, EBSA’s February 10<sup>th</sup> letter, which requested a response by February 17, 2012, was not received by the Institute until February 16, 2012. By email dated February 16<sup>th</sup>, EBSA extended the response date to February 24, 2012 “to account for any delay in your receipt of the letter.” We also note that EBSA’s February 10<sup>th</sup> letter refers to the meeting as taking place on January 27, 2012. Rather, the ICI attended a meeting with EBSA on January 24<sup>th</sup>.

Mr. Joseph Piacentini  
February 24, 2012  
Page 2 of 9

The Institute does, however, engage in research that may be helpful to EBSA's effort to determine what impact, if any, conflicts of interest faced by brokers or others who advise IRA investors have on IRAs and is pleased to share that research with you here.

### The IRA Investor Database

As we have discussed with you, the Institute, in a joint research project with the Securities Industry and Financial Markets Association (SIFMA), maintains 'The IRA Investor Database'.<sup>2</sup> The IRA Investor Database contains certain account-level information from a wide range of participating mutual fund and insurance companies, which provided data for more than 10 million IRA investors in 2007 and 2008 (data for 2009 and 2010 are still being collected). The database is designed so that most of the data elements are comparable to those provided by the IRA trustee on IRS Forms 5498 and 1099-R. To ease the burdens on participating firms the data are collected on an annual basis: the account balances are year-end snapshots; and the contribution, withdrawal, and rollover activity are captured on a tax year basis.

In providing the data to be included in the database, participating data providers encrypt individual records to protect the identities of individuals, but provide, to the extent available, each investor's year of birth; gender; average income for their zip code; IRA assets (at year-end), contributions, withdrawals, and rollovers. The contract agreements with providers that participate in the database prohibit ICI from disclosing individual IRA balances, contributions, distributions and asset allocations, as well as demographic data pertaining to IRA account holders.<sup>3</sup>

The database receives the information for IRA accounts on a snapshot basis (*e.g.*, end of the year) and therefore does not allow for analysis that would focus on, for example, changes in flows and asset allocations to a particular account throughout the year. More specifically, the database does not track for each account: a personal rate of return (EBSA Request #1.a); time-weighted performance, investment strategy, measure of risk, and fee table of each fund/security (EBSA Request #1.b); gross

---

<sup>2</sup> ICI has a number of other on-going research projects related to IRAs. ICI estimates total IRA assets on a quarterly basis drawing on data from the IRS Statistics of Income Division, Federal Reserve Board, American Council of Life Insurers, and the Institute's own mutual fund surveys. Annually, the Institute also conducts a (phone) survey of IRA-owning households to understand their characteristics; as well as their contribution, rollover, and withdrawal activity. For the most recent report, see Holden and Schrass, "The Role of IRAs in U.S. Households' Saving for Retirement, 2011," *ICI Research Perspective* 17, No. 8 (November 2011), available at <http://www.ici.org/pdf/per17-08.pdf>.

<sup>3</sup> To the extent EBSA is interested in the type of non-aggregated data on contributions, withdrawals, rollovers, and account balances in IRAs, such information is filed with the Internal Revenue Service on Forms 5498 and 1099-R.

flows by security/fund transacted date or price, commission/loads, mark-ups/downs in principal transactions or whether transaction was initiated by investor or adviser (EBSA Request #1.c); distribution channels (EBSA Request #2.b), identity or attributes of adviser (EBSA Request #2.c); compensation arrangements (EBSA Request #2.d); advice rendered (EBSA Request #2.e); and adviser service level and type (EBSA Request #2.f).

While the IRA Investor Database™ does not contain the type of data that would allow a review of a particular IRA investor's investment practices subsequent to the receipt of information or recommendation from a broker or adviser, the Institute has published a number of reports that analyze how individuals use IRAs in the process of planning for retirement, which we believe contain findings that are relevant to EBSA's query. To date, ICI has analyzed traditional IRA<sup>4</sup> rollover activity in 2007 and 2008 ([www.ici.org/pdf/rpt\\_10\\_ira\\_rollovers.pdf](http://www.ici.org/pdf/rpt_10_ira_rollovers.pdf)), traditional IRA contribution activity in 2007 and 2008 ([www.ici.org/pdf/rpt\\_10\\_ira\\_contributions.pdf](http://www.ici.org/pdf/rpt_10_ira_contributions.pdf)), and asset allocation of traditional IRAs at year-end 2007 and year-end 2008 ([www.ici.org/pdf/rpt\\_11\\_ira\\_asset.pdf](http://www.ici.org/pdf/rpt_11_ira_asset.pdf)). Key results from the asset allocation analysis include:

- IRAs hold a range of investments, and the largest share of traditional IRA assets are invested in equities and equity funds, both in aggregate and across investor age or income groups.
- The pattern of holdings in traditional IRAs tended to vary with investor age, typically as expected across the life cycle.
  - The percentage of traditional IRA assets invested in bond holdings was higher the older the traditional IRA investor.
  - For the most part, younger traditional IRA investors tended to have a higher proportion of their accounts invested in equity holdings compared with older investors.
  - The oldest traditional IRA investors had higher allocations to money market holdings compared with middle-aged traditional IRA investors. The exception to the typically declining equity holdings pattern by age occurred in traditional IRAs held by investors younger than 35, which were more concentrated in money market holdings and less concentrated in equity holdings than expected (likely resulting, in part, from mandatory cash-out rules for smaller balances).<sup>5</sup>

---

<sup>4</sup> The reference to "traditional IRAs" is meant to distinguish the IRAs that are the subject of this research from Roth IRAs.

<sup>5</sup> See Internal Revenue Code § 401(a)(31)(B) (mandatory cash-out provision); 29 CFR 2550.404a-2 (Safe harbor for automatic rollovers for mandatory cash-outs).

- The pattern of investments among traditional IRA investors was broadly consistent with the patterns observed in 401(k) plans, in aggregate and by investor age.
  - Equities and equity funds were the largest share of both traditional IRAs and 401(k) plans, in aggregate and by investor age, at year-end 2007.
  - Bonds and bond funds represented higher shares of account assets among older investors compared to younger investors, whether looking at traditional IRAs or 401(k) plans. However, in aggregate, traditional IRAs had a higher allocation to bonds and bond funds than 401(k) plans, in part because traditional IRA investors tend to be older compared with 401(k) plan participants.
  - Money market funds had higher shares in traditional IRAs across all age groups compared to 401(k) plans and in aggregate, reflecting in part their use as a default investment for small rollovers and perhaps traditional IRA investors' higher demand for liquidity.
  - Younger investors had higher shares of their accounts (IRA or 401(k)) invested in target date funds. Target date funds were a higher share of 401(k) plan assets in aggregate, likely reflecting their use as default investments in many 401(k) plans.

We would be happy to meet with you to discuss in detail any of these reports.

#### Institute Research on Distribution Channels for IRA Investments

While we do not track distribution channels in The IRA Investor Database™, a recent ICI survey of IRA owners finds that 62 percent of traditional IRA-owning households with a retirement strategy consulted an investment professional when creating the strategy.<sup>6</sup> However, this study did not explore fees paid or the type of specific recommendations made by investment professionals to their clients or whether and to what extent the IRA investor followed the investment professional's guidance (for example, we do not have information responsive to your questions 2.b-f.). In another and earlier study of mutual fund-owning households with ongoing advisory relationships with an investment professional, ICI explored who takes the lead in making the investment decision when an investment professional is consulted.<sup>7</sup> The survey found that 38 percent of the households indicated that the

---

<sup>6</sup> See Figure 28 in Holden and Schrass, "The Role of IRAs in U.S. Households' Saving for Retirement, 2011," ICI Research Perspective 17, No. 8 (November 2011), available at <http://www.ici.org/pdf/per17-08.pdf>.

<sup>7</sup> The Investment Company Institute undertook a telephone survey in 2006 to examine mutual fund shareholders' use of ongoing financial advisory services. For information on the survey and other survey results, see Leonard-Chambers and

investment professional usually takes the lead in decisions; 34 percent indicated the investment professional and investor make decisions together; and 28 percent indicated that the investor usually takes the lead in decisionmaking. Similar to the other previously referenced study, this study did not explore fees paid or the type of specific recommendations made by investment professionals to their clients.

#### Expenses Investors Incur in Mutual Funds through 401(k) Plans and IRAs

Using a variety of data sources, the Institute estimates the expenses that investors incur when investing through mutual funds, including expenses on 401(k) assets or IRAs held in mutual funds. Such estimates are based solely on a review of total assets held in mutual funds, or 401(k) plans or IRAs held in mutual funds, as well as the expense ratios paid on those assets. Data on assets in mutual funds and their expense ratios are available from a number of sources, such as Lipper, Morningstar, and Strategic Insight. Through proprietary surveys, ICI also collects from its member firms data on 401(k) assets held in mutual funds and IRA balances held in mutual funds.

These data indicate that the expense ratios that all mutual fund investors incur differ little from those incurred for investing in mutual funds through 401(k) plans or in IRAs. For example, in 2010, the (asset-weighted) average expense ratio all mutual fund investors incurred in stock funds was 0.84% (84 basis points). In comparison, 401(k) assets invested in stock mutual funds incurred an (asset-weighted) average expense ratio of 0.71% (71 basis points). IRA investors incurred an (asset-weighted) average expense ratio of 0.83% (83 basis points). Expense ratios incurred on 401(k) assets in mutual funds are marginally lower than those incurred on IRA balances for a number of reasons. For example, 401(k) plan sponsors sometimes cover a portion of 401(k) plan costs, which allows them to select funds or share classes with less built-in servicing costs. Also, there is a more limited role for the services of investment professionals inside 401(k) plans; with IRAs, some of the costs of the services of investment professionals may be borne through expenses reflected in the mutual fund's expense ratio. Furthermore, many 401(k) plans have large average account balances, and such economies help to reduce the fees and expenses of the funds offered in these plans.

EBSA seeks to tie current account holdings in IRAs to the advice or recommendations received by the particular account holder from a broker (or investment professional) and draw conclusions as to whether potential conflicts that a broker may have had impacted the investment outcome of the IRA account. As we explained in our January 13<sup>th</sup> letter, the type of comprehensive individual account IRA data – showing the transition of an individual account from recommendation to investment – does not

---

Bogdan, "Why Do Mutual Fund Investors Use Professional Financial Advisers?" *Investment Company Institute Research Fundamentals* 16, No. 1 (April 2007), available at [www.ici.org/pdf/fm-v16n1.pdf](http://www.ici.org/pdf/fm-v16n1.pdf).

reside with the Institute and its mutual fund members. As we also noted, households owning mutual funds outside of workplace retirement plans (including IRA investors) purchase their mutual funds through a variety of sources. Institute household survey research finds that 80 percent of households that owned mutual funds outside a workplace retirement plan held mutual funds purchased through an investment professional.<sup>8</sup> Investment professionals include registered investment advisers, full-service brokerage firms, independent financial planners, bank and savings institution representatives, insurance agents, and accountants. In many cases, the mutual fund investments are held in omnibus accounts<sup>9</sup> and the entire relationship and all contacts with the investor are maintained through the financial intermediary, not the mutual fund company. Even in cases where an investor purchases mutual funds for an IRA account directly from a fund company, rather than through an investment professional, the fund company would not know what the decision-making process of the investor was or have the type of investor demographic information the letter calls for.

Accordingly, while the Institute maintains comprehensive information about behavior patterns of IRA investors, including information about how they invest their account balances, identified by demographic data points, and whether they rely on investment professionals in making investment decisions, it does not maintain information regarding specific sources of information or recommendations that generated a particular IRA holder's investment decisions.

#### Other Sources of Data

While we do not have the particular information called for in your letter, as we are sure EBSA knows, the Securities and Exchange Commission's (the "Commission") books and records rules, Rule 17a-3 and Rule 17a-4 under the Securities Exchange Act of 1934 ("Exchange Act") (hereinafter the "Books and Records Rules"), subject broker-dealers to comprehensive requirements with respect to the collection and maintenance of records regarding customer transaction activity. Additional record collection and maintenance rules apply to the extent the broker-dealer has discretionary authority over the account or is required to make a suitability determination under the Federal securities laws or under

---

<sup>8</sup> Among mutual fund-owning households in May 2011, 31 percent owned funds solely outside of employer-sponsored retirement plans, and 37 percent had funds both inside and outside these plans. Among these households owning mutual funds outside such plans, 80 percent owned funds purchased from an investment professional. See Figure 8 in Bogdan, Holden, and Schrass, "Characteristics of Mutual Fund Investors, 2011," *ICI Research Perspective* 17, No. 6 (October 2011), available at [www.ici.org/pdf/per17-06.pdf](http://www.ici.org/pdf/per17-06.pdf).

<sup>9</sup> An omnibus account is a master account representing the subaccounts of multiple investors that may include a mix of investor account types. An omnibus account is opened on the records of the mutual fund in the name of the intermediary and the fund complex typically does not have any information identifying or otherwise relating to the beneficial owners of the subaccounts.

the requirements of a self-regulatory organization of which the broker-dealer is a member.<sup>10</sup> It is important to note, however, that such records are maintained in a format necessary to comply with regulatory requirements and not necessarily to respond to data survey requests. In this respect, while certain records (for example, "blotter" entries containing an itemized daily record of all purchases and sales of securities and for what account) may be entered by some broker-dealer firms into computerized data fields and maintained in digital format, other records, such as ledgers, copies of confirms, etc., may be maintained solely in hard copy or *pdf* format. Trying to piece together such records, which may be on different systems or stored in various formats at the broker-dealer, may require costly and time-consuming work and is unlikely to allow for consistent data sampling from broker to broker.

#### Utility of the Data to Meet EBSA's Goals

Moreover, as we have also pointed out in our January 13<sup>th</sup> letter, even if EBSA were able to collect information on recommendations provided to IRA holders and line up such information with current account information, we have concerns about the "practical utility" of using this kind of data to draw conclusions about broker-dealer behavior. As we have previously discussed with EBSA, it is not clear how a researcher would measure the extent to which a broker or investment professional did or did not act in the interests of clients with the type of data EBSA is trying to collect. For example, in doing any such analysis, it is not possible to judge the quality of advice or assistance to an IRA holder by looking only at the investments in the IRA account without also knowing what other investments the IRA owner, as an individual or a household, might hold. IRA investments might seem aggressive or undiversified when viewed alone but be reasonable and appropriate in the context of the entire portfolio of the individual or household. Furthermore, the interactions between investment professionals and their clients are complex, and clients do not always follow recommendations they receive. Disentangling these complex interactions and their effects on the investors' returns is beyond the scope of the statistical analysis EBSA apparently has in mind.

While we support the efforts of EBSA to properly assess the need for revisions to the fiduciary definition before re-proposing the investment advice fiduciary rule, we think that it is crucial that any such effort be based on findings about current practices that can only be achieved through an analysis of relevant data collected pursuant to valid data sampling techniques. In this respect, the scope and purposes underlying the Paperwork Reduction Act may be particularly instructive and helpful here. As you know, the Paperwork Reduction Act applies to the "collection of information" by an agency.<sup>11</sup>

---

<sup>10</sup> See Rule 17a-3(a)(17)(i). See also FINRA Rules 2090 and 2111, SEC Exchange Act Rel. No. 63325 (Nov. 17, 2010).

<sup>11</sup> "Persons" is defined broadly to include corporations, associations, partnerships, and the like. 44 U.S.C. § 3502(10). The requirements of the Paperwork Reduction Act apply regardless of whether the request for information is mandatory or

"Collection of information" is defined to mean, as relevant here, "the obtaining, causing to be obtained, soliciting, or requiring the disclosure to third parties or the public, of facts or opinions by or for an agency, regardless of form or format, calling for . . . answers to identical questions posed to, or identical reporting or recordkeeping requirements imposed on, *ten or more persons*,<sup>12</sup> other than agencies, instrumentalities, or employees of the United States[.]" 44 U.S.C. § 3502(3)(A)(i) (emphasis added).

When an agency attempts the "collection of information" as defined by the statute, the agency must engage in a notice and comment period.<sup>13</sup> After which, OMB then approves or disapproves the request, based on its determination of whether the information is "necessary for the proper performance of the functions of the agency, including whether the information shall have practical utility."

44 U.S.C. § 3508. *See generally* Memorandum for the Heads of Executive Departments and Agencies, and Independent Regulatory Agencies, from Cass R. Sunstein, Administrator of the Office of Information and Regulatory Affairs (April 7, 2010).

While we assume that EBSA made a determination that its December 15<sup>th</sup> and February 10<sup>th</sup> requests were not subject to the notice and public vetting process required by the Paperwork Reduction Act, we do think that many of the Institute's concerns, which are focused on ensuring that any revision of the fiduciary rule "gets it right" and is based on valid findings drawn from relevant data, could be alleviated by first assessing whether the information being requested will have "practical utility" within the scope of the Act. In this respect, we encourage EBSA to—

---

voluntary. 5 C.F.R. 1320.3(c) (providing that definition of "collection of information" applies "whether such collection of information is mandatory, voluntary, or required to obtain or retain a benefit").

<sup>12</sup> The regulations provide that the determination of whether ten or more persons received the request should include any requests made by the agency within any 12-month period, 5 C.F.R. 1320.3(c)(4), and that "ten or more persons" includes "any independent entities to which the initial addressee may reasonably be expected to transmit the collection of information during that [12-month] period[.]" *Id.*; *see also* *Ctr. for Auto Safety v. Nat'l Highway Traffic Safety Admin.*, 244 F.3d 144 (D.C. Cir. 2001) (holding that agency's collection of information from airbag manufacturers was unenforceable because manufacturers needed to collect information from their numerous suppliers in order to respond). Finally, the regulations provide that "[a]ny collection of information addressed to all or a substantial majority of an industry is presumed to involve ten or more persons." 5 C.F.R. 1320.3(c)(4)(ii).

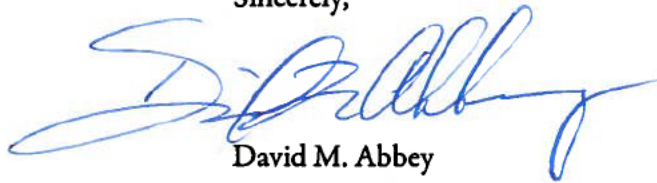

<sup>13</sup> The agency must first publish a 60-day notice in the Federal Register soliciting public comment on the proposed collection of information. The agency must consider any comments received and then submit the proposed collection of information to OMB. An additional notice in the Federal Register is required to alert the public to the start of OMB review and inform interested parties that they may submit comments to OMB during a 30-day period. 44 U.S.C. § 3508.

Mr. Joseph Piacentini  
February 24, 2012  
Page 9 of 9

- Determine whether the data exist in a format readily obtainable and/or whether differences in how brokers and others maintain their records will impact EBSA's ability to obtain a valid sampling of data derived from a proper cross-section of firms.
- Evaluate whether the costs associated with the collection of trading and client data, much of which is likely found only in hard copy or *pdf* format, can be justified in light of the likely utility of such data and the availability of existing research providing relevant findings.<sup>14</sup>
- Consider whether there will be gaps in the data sampling (*e.g.*, the data show a single investment in one account, but not the investor's total portfolio) and how such gaps might impact how a researcher could measure the extent to which a broker or investment professional did or did not act in the interests of clients.

We appreciate being able to share the Institute's research findings with EBSA and our thoughts on how EBSA might better ensure that any findings it makes are drawn from relevant data. We would be happy to discuss any of the matters set out in this response at your convenience. Please do not hesitate to call me.

Sincerely,

David M. Abbey  
Senior Counsel – Pension Regulation

cc: The Honorable Phyllis C. Borzi  
Michael L. Davis  
Alan D. Lebowitz

---

<sup>14</sup> As discussed above, the Institute's research shows that IRA investors invest their IRA account assets in much the same way as they invest their 401(k) account assets and that differences in investment patterns among IRA holders are more likely to be based on demographic differences, such as age, than some other factor.

Joseph S. Piacentini  
Director, Office of Policy and Research  
Employee Benefits Security Administration  
U.S. Department of Labor  
200 Constitution Avenue, NW, [REDACTED]  
Washington, DC 20210

Re: Definition of Fiduciary IRA Data Request

Dear Mr. Piacentini:

Thank you for your letter of December 15, 2011, regarding the Department of Labor's (Department) request for data related to the regulatory impact analysis for the reproposal of the ERISA fiduciary definition, and for the helpful meeting of January 27, 2012, to discuss and clarify that request.

We include with this letter the data the Financial Services Institute (FSI) is able to provide at this time in response to the Department's request. As we discussed at the meeting, the timeline under which the Department has asked us to respond – starting with a December 15 letter received on December 18, a few days before the holidays when many of our members and FSI were operating with a reduced staff; a meeting on short notice on January 27; a letter of February 10 asking for a response by February 17, which we received on February 14; and ultimately the February 24 response date – has severely constrained our ability to be responsive.

The period since the December 15 request has been a particularly demanding time for our members, between their regular year-end reporting and financial accounting obligations, their ongoing compliance requirements, and the need to devote resources to meeting new mandates of the Department and our securities regulators. Moreover, for the reasons discussed below, even a partial response to the Department's request would require an extraordinary amount of time and effort for our member firms, well beyond the response time allowed by the Department. Accordingly, the assistance we are able to provide is quite limited.

### About FSI

FSI is the voice of independent broker-dealers and independent financial advisors in Washington, D.C. FSI represents well over 100 independent broker-dealers and 35,000 independent financial advisors who provide financial advice, products and service to more than 15 million households. Member firms formed FSI to improve their compliance efforts and promote the independent broker-dealer business model. Our members have been an important and active part of the retirement community for more than 30 years, helping retirement plan participants and IRA owners achieve their retirement security and other financial goals and objectives. FSI members have a vested interest in a sound retirement system, and are committed to preserving the valuable role that independent broker-dealers and independent financial advisors play in helping Americans achieve their retirement savings goals.

### Data Provided in Response to the Request

As we explained at the January 27 meeting, FSI does not itself have or maintain any account-level IRA data. As a member benefit, FSI conducts annual benchmarking studies focused on the management and operation of independent broker-dealer firms; those surveys do not solicit or collect data with respect to the characteristics and performance of investor accounts in the IRA or any other market. During our meeting, we described these surveys, and you expressed an interest in reviewing our Broker-Dealer Financial Performance Study. Pursuant to your request, we enclose a copy of that study for 2009, 2010 and 2011.

As the Department reviews the Financial Performance Studies, it is important to understand their limitations. Specifically:

- The data on which the Financial Performance Studies are based reflects a subset of our member firms that choose to voluntarily respond to the survey. We have been fortunate to have significant membership participation in the study. However, the survey sample is not selected by FSI in order to create a statistically valid sample.
- While the Financial Performance Studies provide anecdotal information that our member firms find useful for comparison and benchmarking purposes, they are not a valid basis from which to extrapolate the performance of the independent broker-dealer community at large or the entire broker-dealer industry.

We hope this information will be helpful to the Department as it considers whether to repropose a new fiduciary definition.

FSI is Unable to Provide Additional Data on the Department's Timeline

Any additional data we might provide in response to the Department's request would come from our member firms on a voluntary basis, and such data is not available at this time, for the reasons discussed below.

At the outset, we note that we have serious doubts about the premises and methodology implicit in the Department's data request. The data request suggests that the Department could draw conclusions – sufficiently reliable to base an enormously consequential regulation like the ERISA fiduciary definition – about the “impact, if any, of conflicts of interests faced by brokers or other[s] who advise IRAs ... on IRA investors” from investment returns or trading histories in IRA accounts, analyzed against a (unavoidably, select and less than comprehensive) range of variables. We respectfully disagree, for the following reasons:

- Investment activity and results do not by themselves capture the value of the services provided by financial advisors, whether acting in a broker-dealer or investment advisory capacity. Financial advisors provide value to IRA investors in many ways other than the investment recommendations or advice they provide. They may, for example, give a fearful investor the confidence to set aside funds for retirement. They can help an inexperienced investor fill out the paperwork to get started with an IRA. They may coach an IRA owner on how best to prepare for retirement, balancing other financial needs and taking into account retirement savings in and out of the IRA. They can assist the IRA owner in developing an effective retirement income strategy. That is, financial advisors constructively impact IRA owners in many ways that are not and cannot be measured by the data the Department requested.
- Even if the focus is narrowed to investment services, neither investment returns, nor trading history, nor any of the other investment data the Department requested is a valid indicator of whether the IRA owner has been effectively and impartially served by a financial advisor. It is elementary that a financial advisor may be serving ably and with integrity both, for example, a sophisticated 40-year old with substantial outside assets aggressively seeking alpha in her IRA account through day trading of derivatives, and a retiree with limited assets seeking a risk-free IRA portfolio generating a reliable

income stream, where the IRA owners' investment activity and results are very different on an absolute basis or on a relative basis when compared to their respective benchmarks. Even if the Department had access to perfect information – including all the nuanced, personal information about the IRA investor and his or her objectives and needs that financial advisors routinely take into account but do not fit neatly into a data set – in the end the Department inevitably would be making its own subjective, 20-20 hindsight judgment, from a paper record, about the professional advice and motivations of financial advisors. This is a treacherous basis on which to regulate.

Nonetheless, we contacted a number of FSI members to determine if they, on a voluntary basis, would be able to assist the Department with the data request. While our members are in principle willing to be of assistance, they are unable at this time to provide responsive data, for the following reasons:

- Our members, for business and regulatory reasons, do maintain records of identifying and transactional information for the investors served by their independent financial advisors, including IRA owners, and the basis on which financial advisors are compensated.
- Our member firms do not, however, have access to much of the data requested by the Department necessary to meaningfully construct the dependent, independent or control variables of interest to the Department. For example:
  - Broker-dealers and investment advisers are not required to maintain records of some of the essential data points requested by the Department, e.g., whether the investor followed the recommendations or advice of the financial advisor.
  - Neither broker-dealers nor investment advisers are required to maintain ten-year records of customer investment histories. Any data our member firms could provide would reflect a considerably shorter time frame than that requested.
  - Because financial advisors change broker-dealer affiliations from time to time, and investors often follow the advisors to their new firms, the history for a given IRA investor may be scattered across the records of more than one firm.
- With respect to the data our member firms do retain, that data is generally not in a form that would allow it to be readily retrieved in the

format requested by and useful to the Department. It would be typical for that data, to the extent it exists, to be spread across multiple systems and paper records, and to be maintained in part by our member firms and in part by the independent financial advisors. Thus, to provide a data set even partially responsive to the Department's request, an FSI member firm would be obliged to construct that data set on a custom basis, drawing not only on its own digitized records but also its paper records and the records of all its independent advisors serving IRA owners.

- The process of collecting, extracting, compiling, normalizing, inputting, formatting and validating that data would be an extraordinary undertaking, requiring the expenditure of very substantial financial and human resources. Estimates from our members to develop even a partial data set range from several hundred thousand to several million dollars, depending on the size of the firm.
- Even if a member firm had been able to start that process on December 15 – the date of the Department's data request – that undertaking could not possibly be completed until many months after the February 24 deadline.
- Finally, we would also need to resolve the important issues under SEC Regulation SP and other applicable law that require our member firms and their financial advisors to preserve the privacy of client-level information of the type requested by the Department, which furthermore may limit the Department's ability to make the requested data part of the public record for any proposed rulemaking.

Accordingly, it simply is not possible for our member firms to provide responsive data on the Department's tight timeline.

#### Conclusion

FSI is committed to continued constructive engagement in the regulatory process and, therefore, we welcome the opportunity to work with you on this important regulation.

Thank you for your consideration of our letter. Should you have any questions, please contact me at [REDACTED]. For the timely delivery of any written correspondence, my email address is [REDACTED]@[financialservices.org](mailto:[REDACTED]@financialservices.org).

Respectfully submitted,

answers@fainsight.com

PO Box 1955

Tacoma, WA 98401

**www.fainsight.com**

Formed in January 2004, the Financial Services Institute's (FSI) mission is to create a healthier regulatory environment for independent broker-dealers and their affiliated independent financial advisors through aggressive and effective advocacy, education and public awareness. FSI is a tax-exempt, non-profit association formed under section 501(c)(6) of the Internal Revenue Code. Our members are independent broker-dealers who do business with the public and independent financial advisors affiliated with broker-dealers.

We are pleased to offer the *2009 FSI Broker-Dealer Financial Performance Study* as an exclusive benefit to FSI broker-dealer members and wish to thank all of the participating firms who contributed to the success of this annual project. We encourage you to take advantage of all the exclusive benefits of your firm's membership and look forward to your participation again next year. For more information, please visit our Web site at <http://www.financialservices.org>.

FA Insight LLC provides research and consulting services to financial advisory firms and those that service or work with these firms. FA Insight provides clients with actionable insight that is based on a powerful combination of unique marketplace data, consulting and analytical expertise, and deep knowledge of financial advisors and their business environment. Core services focus on: performance benchmarking, "best practices" research, strategic business planning, organizational design and compensation modeling. For more detail please visit the FA Insight Web site at <http://www.fainsight.com>.

## Acknowledgments

We gratefully acknowledge the 54 FSI member firms who committed their time to compile and report data for the benefit of this initiative. We extend a special thanks to the volunteers on the 2009 Broker-Dealer Financial Performance Study Task Force: Matt Bauler, Milton Fritts, Brock Guice, Bardi Huppert and Greg Williams. We also acknowledge the work of previous FSI task forces and Moss Adams LLP, who led production of prior years' reports. Much of the organization, format and classifications found in the 2009 report is built from the foundation of what was prepared in past years.

## Legal Disclaimer

This Study and all included data is the property of the Financial Services Institute (FSI). No portion of this document may be reproduced, stored in a retrieval system, distributed or transmitted, in any form or by any means without the express written consent of FSI.

# 2009 Financial Performance Study

## Analysis of Results

### Overview/Executive Summary

Broker-dealers rode a wave of growing revenues and improved profitability through 2007, a trend which came to an abrupt halt in 2008. Firms were especially hard-hit in the year's final quarter following the steep decline in the financial markets that began in September of 2008. As a result, the operating profit margin for the typical broker-dealer in our survey dropped from 2.8% in 2007 to 2.1% in 2008 (Figure 1).

**Figure 1: Median Operating Profit Margin, 2004–2008**

The overall industry average profit margin for 2008, at 3.3%, was significantly higher than median profit. The 2008 average also exceeded the 2007 average operating profit margin of 2.0%. This is a result of the industry's largest firms tending to enjoy much greater success than their smaller counterparts in 2008. Firms with more than \$250 million in annual revenue, for example, had average profitability of 4.2% of revenues. The higher margins typical of these larger firms, which are defined in terms of revenue size, naturally receive a larger weight in calculating the average margin.<sup>1</sup>

Figure 2 demonstrates the wide disparity of profitability achieved by firms in this year's survey. The number of firms with operating profit margins of 6.0% or greater is equal to the number of firms who had negative margins of more than 2%.

<sup>1</sup>Note that sampling variability will also come into play when comparing this year's survey results against previous years. Averages can be more vulnerable to this variability than medians. This is especially true for the 2008 results, with proportionately more large firms (\$100 million and greater in revenue) participating than in 2007.

**Figure 2: Number of Firms by Operating Profit Margin**

Overall, two-thirds of firms earned a positive operating profit in 2008; the lowest percentage of firms with positive income since the industry was climbing out of the last market downturn in 2003 (Figure 3). Many firms are likely to continue struggling in 2009. Results for 2008 only partially reflect the full brunt of the market drop and economic recession, both of which came on in force during the final quarter of 2008.

With that said, it appears that broker-dealers are much better positioned to confront the current market drop and recession when compared with the last downturn. In addition to tracking the percentage share of firms making a positive operating profit, Figure 3 also shows market return over the last decade. For the purposes of this illustration, the Russell 3000® broad market securities index serves as a proxy for financial markets performance.

**Figure 3: Percentage of Profitable Firms and US Equity Market Return, 1999–2008**

During the 2000–2002 market downturn the number of profitable firms fell sharply from 78% of the survey database in 1999 to a bottom of 53% in 2001. In the wake of 9/11 during the previous year and the Enron and Worldcom scandals, the sharpest drop of the previous securities market downturn came in 2002. Despite the 22% market drop, however, a greater share of broker-dealers achieved profitability in 2002 as weaker players left the business or consolidated with others and survivors implemented efficiency measures.

As a result of threats weathered in the recent past, broker-dealers today are better run and more competitive. The 37% market drop witnessed in 2008 was unlike any other in our generation. Broker-dealers clearly have felt the impact of this decline but, unlike in previous years, they are now better prepared to manage through it. Firms are stronger operationally. The continued evolution toward advisory fees and asset management has helped broker-dealers to diversify and smooth revenue streams, which has helped their affiliated advisors develop deeper and more lasting relationships with clients.

The growing number of wirehouse advisors transitioning to independence is another important factor behind broker-dealer success in a tough economic climate. Broker-dealers are becoming an increasingly attractive affiliation option for former wirehouse advisors, which is easing (but not eliminating) the long-standing challenge of broker-dealer growth through recruitment.

Transitioning wirehouse advisors are motivated by both “push” and “pull” drivers. A tarnished wirehouse brand, often accompanied by deteriorating economics for the advisor, is pushing many wirehouse advisors to seek an alternative affiliation model. The growing sophistication and maturity of broker-dealers, particularly as it relates to operations, technology and product availability, provides the pull.

Surprisingly it is revenue mix and not profits that is perhaps the single most notable difference between this year’s survey results and last year’s. Changes in revenue composition reflect a movement toward fee-based or managed money and away from commission-based products.

While the trend toward an increasing reliance on asset management and advisory fees has been in progress for some time now, 2008 marked a noted acceleration of this growth. Asset management and advisory fees averaged 30.7% of revenues in 2008, more than 1.5 times the 18.5% share measured in 2007 (Figure 4).

**Figure 4: Distribution of Firm Revenue by Source, 2007–2008**

Note, however, that some of the apparent growth in average revenue share related to fees may simply be due to differences in the 2008 sample versus participants in 2007. Looking at specific firm size ranges across the two years provides additional insight. Firms in the size ranges under \$100 million in revenue appear to have increased their proportion of fee-related revenue by only one to two percentage points. In contrast, for firms over \$100 million in size, fees accounted for an average of 18% of revenues in 2007 but jumped dramatically to 33% of revenues in 2008.

Regardless, the trend toward fee revenue continues, and it has important and positive profit implications. For example, firms in the highest quartile in terms of operating profit margin generate double the share of revenue from asset management and advisory fees than other firms. Fees average 40% of revenue for high-profit firms compared with 19% of revenues for other firms. Fee revenue does not just originate with the corporate RIA. For the typical high-profit firm, AUM in advisor-owned RIAs is 1.5 times the AUM in the firm’s corporate RIA. In contrast, for other firms AUM in advisor-owned RIAs is only about one-tenth the level of corporate RIA AUM.

While the share of commissions contracts as part of the overall revenue mix of firms, another interesting dynamic appears to be taking place within commissions. At the expense of all other sources of commission revenue, mutual fund commissions actually increased in share of revenue, rising dramatically from 18.6% of revenue in 2007 to 26.9% in 2008. Again there is the possibility of differences in survey participants driving some of this change. In the 2008 survey, firms with more than \$250 million in revenue were especially reliant on mutual funds, where this source accounted for an average of 34% of revenue. In any case, growing reliance on mutual funds is another indicator that broker-dealers and their affiliated advisors are further embracing managed money solutions for their clients.

In contrast with operating profit, gross profit (revenue less direct expenses) increased both in median and average terms. Average gross profit margin showed the strongest rise,

jumping from 18.3% in 2007 to 23.1% in 2008. The gross profit increase was fueled by a corresponding expense decrease in commissions paid.

Firms did struggle with operating expenses, which increased from an average of 16.1% of revenues in 2007 to 19.8% in 2008. In particular, salaries and wages as well as marketing expenses consumed a much greater share of revenues. While marketing expenses averaged just one half of a percentage point of revenues in 2007, this measure roughly tripled to 1.5% in 2008. Firms appear to be ratcheting up marketing budgets in response to growing pressure to stand out and be heard amid the crowded and intensely competitive recruiting market for advisors.

Expenses related to salaries and wages climbed to 7.7% of revenues in 2008 versus 6.2% in 2007. This is not likely due to rising levels of compensation. Rather, it seems that revenue growth has not kept pace with staffing levels. For example, revenue per employee for the typical firm fell 10%, from \$1.056 million in 2007 to \$952,518 in 2008. In other words, firms were reluctant to adjust staffing levels in response to the market downturn (at least through the end of 2008).

### **High-Profit Firms**

Despite weaker profitability for the typical firm in this year's survey database, an elite subset of firms not only made a profit but prospered as well. Their performance is especially admirable given the current economic climate. Together these firms hold out promise for other firms that wish to model their success.

These top-performing firms are distinguished on the basis of profitability and referred to in the study as "high-profit" firms. High-profit firms are defined as any firm in the top 25% or upper quartile of respondents in terms of operating profit margin. Results for high-profit firms are separated from "other" firms. For this year's report, respondents with an operating profit margin of 4.5% or higher were designated high-profit.

The typical high-profit firm earned a profit margin of 7.3% in 2008. In comparison, their lower-earning peers operated at a loss with a median margin of negative 1.7%. Many of the high-profit firms tend to be larger in size and are benefitting from economies of scale. As shown in Figure 5, nearly half (45%) of all firms grossing more than \$250 million in revenue were deemed high profit. The greater size of these firms allows them to more broadly spread significant fixed costs related to technology, regulatory compliance and marketing.

**Figure 5: Distribution of High-Profit Firms by Revenue Size**

But clearly not all large firms are high profit—a fair share of high-profit broker-dealers exists among the survey's smallest firms. While economies of scale are not in their favor, these firms are also able to deploy size to their advantage. Their small size may enable them to provide more intimate and customized service, establish more personal and longer-lasting relationships with advisors and better note any irregularities with regard to compliance.

While extreme size, especially at the large end, appears to support profitability, three other themes also are common among high-profit firms:

- Recruiting and retention practices that attract and retain higher producing advisors
- Greater reliance on fee business including higher acceptance of advisor-owned RIAs
- Higher producing advisors overall that are also younger in age

High-profit firms enjoy greater success in attracting and retaining higher producing advisors. This advantage starts with recruitment. As presented in Figure 6, high-profit firms are less apt to take on lower production advisors. Advisors under \$50,000 in production accounted for 60% of the advisors recruited by high-profit firms in 2008. This share for other firms, at 76%, was substantially higher. As production levels increase, high-profit firms take an increasing larger share of recruits relative to other firms.

**Figure 6: Distribution of Advisors Added in 2008 by Production, High-Profit Firms and Others**

More so than others, high-profit broker-dealers have a greater willingness to look beyond traditional sources for recruits. For 2009, high-profit firms expect to recruit just 58% of advisors from other broker-dealers (Figure 7). This compares with 71% for other firms. The high-profit firm expects 26% of its recruits to come from other non-traditional sources. These sources typically include career-changers from other industries or young professionals just starting a career. A few of the surveyed high-profit firms even mentioned looking to RIA firms as a source of new talent.

**Figure 7: Expected Sources of New Advisors, High-Profit Firms and Others**

High-profit firms also appear to be deploying turnover in order to better shape a higher producing advisor base. For the typical high-profit firm advisor, turnover runs slightly lower than for other firms. Of the total advisors with high-profit firms in 2007, 13.6% left their broker-dealer during 2008. This compares with a median of 15.1% turnover for others. Relative to other firms, however, turnover at the typical high-profit firm for the lowest producing advisors is much greater at high-profit firms. The typical high-profit firm had 28.1% of its advisors with less than \$50,000 production leave during 2008 compared with 24.2% at other firms. This finding suggests high-profit firms have a lower tolerance level for advisors failing to meet minimum production requirements.

**Figure 8: Median Advisor Turnover, High-Profit Firms and Others**

Another important distinguishing characteristic of high-profit firms is a greater acceptance and reliance on fees as related to asset management and advice. As noted in Figure 9, fees averaged 40% of revenue for high-profit firms, a share that is about double that of other firms.

**Figure 9: Average Distribution of Fees by Revenue Source, High-Profit Firms and Others**

For high-profit firms, embracing fee-business goes beyond advisors managing money on the corporate RIA platform. High-profit broker-dealers are more likely to allow advisor-owned RIAs. An RIA for planning purposes is allowed by 79% of high-profit firms compared with 55% of other firms. An advisor-owned RIA for asset management is allowed by 64% of high-profit firms compared with 50% of others. To better control costs and ease compliance monitoring, however, high-profit firms that allow advisors an RIA for asset management are much more likely to mandate that their advisors use a particular custodian. About two-thirds of high-profit firms mandate custody versus just one-fourth of other firms.

The greater reliance on asset management and advisory fees for high-profit broker-dealers can contribute to greater profitability in several ways. Fee business diversifies a broker-dealer's revenue stream and can often be a steadier form of revenue compared with commissions. Fee business also serves to diversify a broker-dealer's end-client base, attracting a different type of client. As fees emphasize relationships over product sales, client tenure can also be longer lasting. Perhaps most important, however, is that a broker-dealer's acceptance of fee business may facilitate attraction and retention of advisors that are more profitable for the firm to serve.

Advisors at high-profit firms produce greater revenue for their broker-dealer. Median revenue per advisor at high-profit firms is \$152,726, 25% greater than the \$121,401 at other firms. At any level of production there are fixed costs of on-boarding and servicing an advisor. As a result, servicing high-productivity advisors creates a tremendous profitability advantage for broker-dealers.

Recruiting methods and fee orientation likely support the ability of high-profit firms to maintain an advisor force that is experienced yet less dominated by advisors on the verge of retirement. As shown in Figure 10, 61% of advisors at high-profit firms are between the ages of 36 and 55, compared with 53% for that age group at other firms. Just 29% of

advisors at high-profit firms are approaching retirement at 55 of years of age or older. This figure compares with 35% at other firms.

**Figure 10: Average Distribution of Advisors by Age, High-Profit Firms and Others**

### Advisor Compensation

Similar to the past years, advisor compensation was virtually unchanged for 2008. Few differences arose in the median payouts across the payout grid from the last two studies, for both independent and insurance-affiliated broker-dealers (Figures 11 and 12). One exception was median payouts for independent broker-dealers at \$50,000 in advisor production, with an increase of 10 percentage points. The median 80% payout at \$50,000, however, is equivalent to the payout for the \$50,000 production level in 2006. Insurance-affiliated broker-dealers had nearly identical payouts at all ranges. In reviewing the upper quartile of payout percentages for the largest producers, payout was 93% for independent broker-dealers, slightly higher than the 92% rate paid in 2007. Upper quartile payouts for insurance-affiliated broker-dealers matched the 92% rate of last year.

**Figure 11: Independent Broker-Dealer Payout in 2007 and 2008**

**Figure 12: Insurance-Affiliated Broker-Dealer Payout in 2007 and 2008**

Both insurance-affiliated and independent broker-dealers made notable changes in the treatment of fixed products from 2007 to 2008. For insurance-affiliated broker-dealers in 2008, there were changes in every type of approach to fixed products (which includes life insurance, annuities and disability insurance). Compared with last year, they were more likely to fully include the production associated with fixed products in the broker-dealer's overall production grid (an increase of 6 percentage points). With a decrease of 14 percentage points, insurance-affiliated broker-dealers were significantly less likely to process fixed products through their parent company.

**Figure 13: Insurance-Affiliated Broker-Dealer Approach Toward Fixed Product Compensation, 2007–2008**

Independent broker-dealers had noteworthy changes in their treatment to both fixed and variable products. For fixed products, with a decrease of 15 percentage points, they were less likely to fully include the production associated with them in the overall grid for production through the broker-dealer. With an increase of 12 percentage points, they were more likely to count the production toward the overall grid, but determine the payout separately. Half of independent broker-dealers chose this approach, with a median minimum payout of 83% and a median maximum payout of 93%. Regarding variable products, this year 33% of independent broker-dealers chose to fully include the production in the overall grid for production through the broker-dealer, an increase of 12 percentage points. Although with a decrease of 17 percentage points, independent broker-dealers are less likely to have no arrangements for variable products—they are still the majority, with 57% of respondents choosing this option.

## Recruiting and Retention

An aging broker-dealer field force continues to pressure firms to do a better job at recruiting and retention. In the recent past, a lack of experienced advisors significantly hampered not only broker-dealer growth but growth of the entire financial advice industry. Over the past year, the tight market for broker-dealers to acquire experienced talent may have temporarily eased slightly due to a slowdown in the industry overall as well as the fact that disenchantment among wirehouse brokers has helped increase the pool of potential recruits from which broker-dealers can prospect.

This scenario will not last indefinitely, however. The economy and securities markets will invariably rebound in coming months. Wirehouses will repair their tainted brands and adapt their business models to stem the tide of advisors defecting from their firms. What will not change in the near future is that many advisors, like the clients they serve, are on the verge of retirement.

Broker-dealers will remain vulnerable to this retirement wave. Broker-dealer-affiliated advisors continued to collectively age further in 2008 (Figure 14). The average number of advisors beyond the age of 55 increased from 32% in 2007 to 34% in 2008. Growth will be at risk unless broker-dealers are able to devise creative solutions to address the pending loss of talent.

**Figure 14: Average Distribution of Advisors by Age, 2007–2008**

Ultimately, a broker-dealer has only a limited number of ways it can grow its advisor base. Tactics include recruiting experienced talent, developing new talent or outright acquisition of another broker-dealer. To better leverage the talent that it currently has, a broker-dealer can also choose to focus on retention. While acquisitions were outside of the scope of this study, a variety of findings relate to these other growth tactics.

Regarding retention, in 2008 the typical firm lost 15% of the advisors it ended the year with in 2007. This rate of turnover was up some from the 14% turnover achieved in 2007 but lower than what was measured in 2006. Smaller firms seemed to struggle most with retention. As depicted in Figure 15, a distinct dividing line exists between firms under and firms over \$100 million in revenues. While turnover for large firms ranged between 10% and 11%, small firm turnover ranged from 18% to 21%.

**Figure 15: Median Advisor Turnover by Firm Size**

Higher turnover experienced by smaller firms may be indicative of a lack of scale to appeal to a wide range of advisor types. As advisors evolve their practices they are forced to seek another broker-dealer that can better meet their changing needs. Turnover for smaller firms might also be a result of an eagerness to take on any type of advisor in order to meet ambitious growth goals, only to discover later that some of the recruits are not a good fit for the firm.

Alternatively, turnover may be a conscious strategy as a broker-dealer deliberately seeks to improve the quality of its advisor force by weeding out advisors that no longer fit its target profile. This may be what many firms focused on in 2008 as they aimed to improve the quality of their advisors and ultimately the profitability of their firms.

As depicted in Figure 16, the typical firm shed on net 22 advisors generating less than \$50,000 in production. All other production ranges showed positive net additions with especially good results for the largest producers. The typical broker-dealer netted slightly more advisors producing over \$250,000 than advisors in the \$50,000 to \$250,000 range.

**Figure 16: Median Advisors Lost and Added by Level of Production**

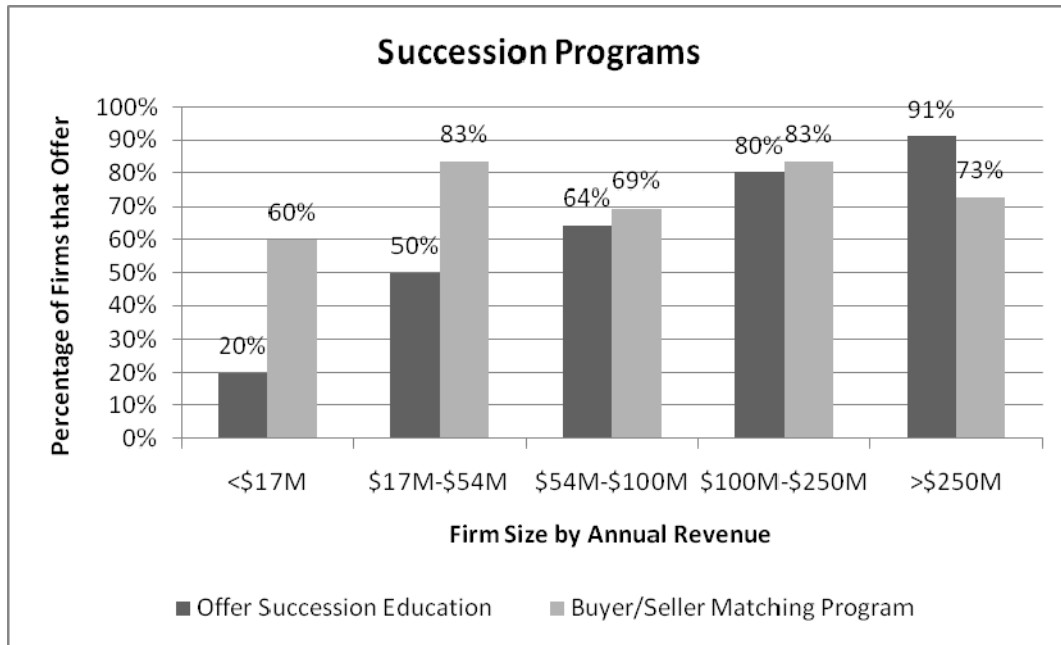

In light of the rising number of advisors nearing retirement, succession assistance can be an important tool for strengthening retention as well as recruiting. Succession programs can bring about several positive outcomes. By facilitating the transfer of a retiring advisor's clients and assets to another advisor within the broker-dealer's network, clients and assets are retained with the broker-dealer.

Less apparent is the power of an effective succession program to serve as a recruiting or retention enticement. Growth-minded advisors will join and stay with a broker-dealer that offers an avenue for practice growth through the acquisition of a succeeding advisor's clients. Advisors approaching retirement will stay with a broker-dealer that is able to provide them liquidity solutions for their practices upon retirement.

Figure 17 shows the growing propensity for firms to provide succession assistance as they increase in size. Nearly all of the industry's largest firms (91%) provide succession education, and 73% offer some type of formal or informal buyer/seller matching program.

**Figure 17: Availability of Succession Education and Transition Assistance**

Regardless of how successful firms are with retention, some form of recruiting will always be in order. Broker-dealers invested heavily in recruiting during 2008 and continued a shift regarding prospects targeted. From 2007 to 2008, marketing expenditures increased markedly on average from 0.5% to 1.5% of revenues. Nearly every recruiting-related expense measure was up. Comparing the typical survey firm this year to last year, advertising, internal and external recruiting costs and account transition expenditures were all up nearly 20% or more.

Figure 18 illustrates the average level of general recruiting-related expenditures by firm size. These data are exclusive of “per advisor” costs related to external recruiters, home office visits or transition assistance. While general costs tend to rise with firm size, the figure highlights the disproportionate burden of recruiting expenditures on small firms in order to remain competitive.

**Figure 18: General Recruiting Expenditures by Firm Size**

In addition to spending more, broker-dealers are also looking farther and wider to attract recruits. As shown in Figure 19, during the last two years, broker-dealers have greatly reduced their expectations for other broker-dealers to serve as a recruiting source of new advisors. Wirehouses and other sources (typically new entrants to the industry) are increasing in importance. The trend is even more apparent among high-profit firms.

**Figure 19: Expected Sources of New Advisors, 2007–2009**

## Asset Management and Advisory Fees

Asset management and advisory fees, increasing for the last several years, became a major source of broker-dealer revenue in 2008. Averaging 19% in 2007, fees jumped to 31% of revenue in 2008.

**Figure 20: Average Distribution of Asset Management/Advisory Fees by Revenue Source**

Both in terms of their reliance on fees and their more tolerant attitude toward advisor-owned RIAs, independent firms have more heartily embraced asset management and advice in comparison to insurance-affiliated firms. As shown in Figure 21, fees accounted for nearly 40% of revenues earned by independent firms compared with 25% for insurance-affiliated firms.

**Figure 21: Asset Management/Advisory Fee Distribution, Independent and Insurance-Affiliated Firms**

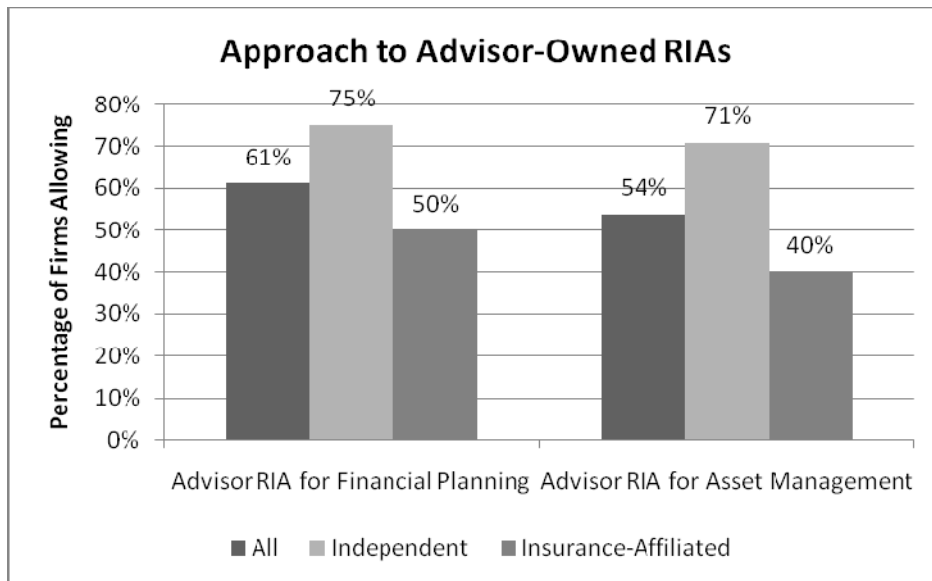

Figure 22 illustrates the more liberal policy independent broker-dealers have toward advisors maintaining their own RIAs. It is now quite commonplace for independent firms to allow advisor-owned RIAs for financial planning as well as asset management. Insurance-affiliated firms, while lagging behind their independent peers, have nonetheless increased their flexibility toward advisor-owned RIAs as well in recent years.

**Figure 22: Approach to Advisor-Owned RIAs by Broker-Dealer Ownership Type**

Operating data presents a strong case for broker-dealers to embrace asset management and advisory business. In Figure 23, broker-dealers are grouped according to their approach toward advisor-owned RIAs. Firms that did not allow advisor-owned RIAs had the lowest

proportion of fee revenue and earned a negative operating profit of 1.8%. The highest profit margins were achieved by firms that allowed advisor RIAs for financial planning only.

**Figure 23: Fee Revenue and Profit Impact by Approach to Advisor-Owned RIAs**

### Independent Broker-Dealers

Independent broker-dealers comprised 44% of the respondents in this year’s study. The “independent” group consists of any broker-dealer that is not operated as a subsidiary of an insurance company. As Figure 24 shows, independent broker-dealers experienced nearly the same average pre-tax operating profit margin, increasing slightly from 4.5% in 2007 to 4.6% in 2008. Despite proportionately greater overhead expenses, independents still managed to easily out-perform insurance-affiliated broker-dealers in terms of average operating profit margin. (Overhead expenses almost doubled as a percentage of revenue for independent firms, increasing from 12.6% in 2007 to 20.3% in 2008.)

**Figure 24: Average Independent Broker-Dealer Profit Margins, 2006–2008**

Unlike last year, independent broker-dealers experienced higher overhead expenses compared with their insurance-affiliated counterparts. In 2008, overhead as a percentage of revenue was 20.3% percent for independent firms and 19% for insurance-affiliated firms. For independent broker-dealers, staff salaries were the biggest area of increase for overhead expenses—rising from 6.3% of revenue in 2007 to 8.5% in 2008. Two other areas with significant increases were marketing expenses and depreciation.

In a trend consistent with recent years, advisors that affiliate with independent broker-dealers maintained higher levels of production than those tied to insurance-affiliated broker-dealers. Median revenue per advisor at an independent broker-dealer was \$182,321 in 2008. This represented a small increase of about \$3,000 from 2007 per capita production. The figure was significantly higher than the 2008 revenue per advisor median for insurance-affiliated firms. Figure 25 further details the differences in production across independent and insurance-affiliated advisor networks.

**Figure 25: Distribution of Advisors by Production, Independent and Insurance-Affiliated Firms**

**Insurance-Affiliated Broker-Dealers**

Broker-dealers, operating as a subsidiary of an insurance company, comprised 56% of respondents in this year’s study. In 2007, for the first time in recent years, the average insurance-affiliated broker-dealer turned a positive operating profit. As shown in Figure 26, this positive trend was short-lived. Facing a challenging economic climate, insurance-affiliated firms averaged a negative 1.4% profit margin in 2008.

**Figure 26: Average Operating Profit Margin for Insurance-Affiliated Broker-Dealers, 2004–2008**

In 2008, more than half of insurance-affiliated broker-dealers survey participants (53%) failed to earn a profit. Firms operating at a loss increased from 30% estimated in each of the past two previous years' studies. As Figure 27 displays, higher overhead expenses on top of lower gross profit margins both contributed to the negative pre- and after-tax profit margins experienced by insurance-affiliated broker-dealers in 2008.

**Figure 27: Average Insurance-Affiliated Broker-Dealer Profit Margins, 2006–2008**

# Reader's Guide

## Report Organization

The *2009 FSI Broker-Dealer Financial Performance Study* reviews in detail the financial as well as operating practices of FSI broker-dealer members. Results are typically presented by size of firm, type of broker-dealer and profitability. In addition to this reader's guide, there are two other major sections of the report:

- Results Analysis
- Detailed Data Tables

### ***2009 Results Analysis***

This summary offers a detailed review and interpretation of the survey findings, including a perspective on this year's trends as they relate to recent history.

### ***Detailed Data Tables***

Detailed data tables are presented at the back of this report. These financial and operating statistics begin on Page 31. Survey results are provided based on all participating firms. Additionally, the data is typically broken out by firm profitability, size and ownership type. Figures are provided for a total of up to nine sub-groups in all.

## Methodology

### ***Data Collection***

Survey data collected from 54 FSI broker-dealer member firms formed the basis for this study. Participation in the study was voluntary and restricted to members of FSI. The survey fielded in 2009, from February 20 to May 11, with firms reporting data as of year-end 2008.

All surveys were submitted directly to FA Insight. All firm-specific information provided is strictly confidential. No persons other than FA Insight project team members were, or will be, granted access to individual company data.

FSI study task force members, representatives from FSI and FA Insight designed the survey form for this year's study. To preserve historical comparability, the survey form borrows heavily from the form developed by FSI and Moss Adams for previous studies.

### ***Data Compilation***

The data for each participant was reviewed separately following submission and all ratios were calculated for individual participants. While FA Insight did not verify the accuracy of the information submitted, respondents were frequently contacted to clear up any discrepancies noted in their submission.

A number of participants provided their financial information in the firm's original chart of accounts rather than the one used in the survey form. To make statements comparable across companies, FA Insight translated firms' existing charts of accounts to the survey form's chart of accounts, consulting with participants when clarification was needed.

In order to present on as much of the reported data as possible, compiled data was based on all responses regardless of whether a firm completed all parts of a question. When data groupings yielded fewer than three responses, however, no estimates were published. In these cases "N/A" is used in the data tables to indicate an insufficient sample size.

### ***Common-Sized Financial Statements***

Fifty-four broker-dealers completed detailed income statement and balance sheet forms using 2008 financial data. Respondent surveys not containing sufficient detail were excluded from the calculation of the common-sized financial statements. For example, if commission revenue was not detailed by product type, the survey data was not used in calculating the common-sized income statements. To calculate the common-sized financial statements for all respondents, a simple average was used.

### ***Averages, Medians and Quartiles***

The bulk of presented data in this report is composed of averages or medians. While averages are often the best representation for the industry or a group as a whole, medians tend to better represent the experience of the typical broker-dealer firm.

The median is the halfway point in a data group, where half the survey results have greater value and half have lesser value. Because extreme outliers in the sample have less influence, medians are more helpful than averages for depicting the typical value in a group of values.

If the group contains an odd number of values, the median is the value precisely in the middle when the values are ranked in order of magnitude. When the group has an even number of values, the median is defined as half the distance between the two values in the middle.

Median ratios are often a common source of confusion. Median revenue per advisor, for example, is correctly calculated by first calculating revenue per advisors for all the firms in the survey. Next, the median is derived from this group of firm ratios. While median revenue for all firms divided into median number of advisors produces a benchmark ratio as well, this calculation cannot be considered a true median.

Quartiles are a natural extension of a median. An upper quartile is used to distinguish a group of high-profit firms in the results analysis and the detailed data tables. The upper-quartile dividing line is a value such that 75% of the values in the sample are below it. Similarly, the lower quartile begins with the value such that 75% of the values in the group are above it.

## **Reporting Groups**

In addition to presenting survey results for all participating broker-dealers, this report groups survey data according to firm profitability, size and ownership. Estimates are provided for a total of nine sub-groups.

### **Profitability**

Results for high-profit firms are distinguished from "all others" based on operating profit margin. High-profit firms are defined as any firm in the top 25% or upper quartile of respondents. For this year's report, respondents with an operating profit margin of 4.47% or higher were designated high-profit. Firms with lower profitability made up the "all other" group.

### **Firm Size**

Participants were grouped by size based on reported 2008 total annual revenue. Revenue categories are as follows: Under \$17 million, \$17 million to \$54 million, \$54 million to \$100 million, \$100 million to \$250 million and greater than \$250 million. Firms over \$250 million in revenue are a new category introduced this year.

### **Ownership**

Respondents were asked whether their firm was independently owned or a subsidiary of a parent organization. The question formed the basis for distinguishing between "Insurance-Affiliated" and "Independent" firms. Note that in previous years' reports, the "Insurance-Affiliated" group included a small share of other parent-owned firms that were not insurance-affiliated. This year, the "Insurance-Affiliated" group only includes those firms owned by an insurance company. The small number of firms in the survey sample not insurance-affiliated but owned by a holding company or parent other than an insurance company are now included in the "Independent" group.

## **Explanation of Financial Information**

---

### **Liquidity**

Liquidity ratios measure a company's ability to meet its short-term obligations.

#### **Current Ratio**

*Formula:*

*Total Current Assets*  
*/Total Current Liabilities*

The current ratio shows a company's ability to pay obligations due within 12 months with assets that are expected to turn to cash within 12 months. A higher current ratio indicates better liquidity, and a lower current ratio may indicate that the company will have difficulty meeting short-term obligations. The key factors that influence this ratio are accounts receivable, commissions, payables and turnover.

**Working Capital**

Formula:

$$\frac{\text{Total Current Assets}}{\text{Total Current Liabilities}}$$

Working capital is the capital a company needs on a day-to-day basis to produce revenue. For a broker-dealer operation, the working capital typically consists of commissions receivable and securities held for resale less the commissions payable to the advisors and the amounts payable to vendors. A high-dollar number for working capital may indicate either very good financial health (if the cash balance is high) or problems with managing the receivables (if the cash balance is low).

**Sales-to-Working Capital Ratio**

Formula:

$$\frac{\text{Total Revenue}}{\text{Working Capital}}$$

The sales-to-working capital ratio measures how much revenue a company produces for a dollar of working capital. The higher the ratio, the more effective the company is in managing its working capital.

**Safety**

Safety ratios measure a company's ability to withstand adversity.

**Debt-to-Equity**

Formula:

$$\frac{\text{Total Liabilities}}{\text{Total Equity}}$$

Debt-to-equity, also known as leverage or debt-to-net-worth, compares the amount of funds invested by creditors with the amount of funds invested by owners.

The higher the debt-to-equity ratio, the more at-risk the business is in the event of an economic downturn. A heavy debt load increases a company's ability to grow during good times; however, a heavy debt load decreases a company's ability to withstand a downturn in profitability. The key factors that influence the debt-to-equity ratio are the company's borrowing, profitability and capital (i.e., sources of funds other than debt).

**Profitability**

Profitability ratios measure a company's profitability at various levels.

**Gross Profit Margin %**

Formula:

$$\left( \frac{\text{Gross Profit}}{\text{Total Revenue}} \right) \times 100$$

The gross profit margin equals gross profit divided by revenue. It represents the percentage of each revenue dollar available for operating expenses.

**Operating Profit Margin %**

Formula:  
 $(\text{Operating Profit} / \text{Total Revenue}) \times 100$

The operating profit margin is the percentage return on revenue after all operating expenses and before other income and expense.

**Pre-Tax Profit Margin %**

Formula:  
 $(\text{Pre-Tax Profit} / \text{Total Revenue}) \times 100$

The pre-tax profit margin is the percentage profit on revenue after all expenses except income taxes.

**Net Profit Margin %**

Formula:  
 $(\text{Net Profit} / \text{Total Revenue}) \times 100$

The net profit margin is the percentage return on revenue after all expenses, including income taxes.

**Employee/Office Productivity**

Employee productivity ratios measure a company's employees' productivity using different measures of efficiency.

**Revenue per Employee (FTE)**

Formula:  
 $\text{Total Revenue} / \text{Number of full-time equivalent employees}$

The revenue per employee provides a measure of the productivity of employees.

**Commission per Advisor**

Formula:  
 $\text{Total Commission Revenue} / \text{Number of Advisors}$

The commission per advisor measures the productivity of the typical advisor.

**Revenue per Advisor**

Formula:  
 $\text{Total Revenue} / \text{Number of Advisors}$

The revenue per advisor is another measure of productivity. Compared with commission per advisor, revenue per advisor also includes assets under management and other non-commissionable production.

---

**Commission Analysis**

Commission analysis looks at how many times a year commissions are paid, as well as by number of days and what the commission payout percentage is based on, financial statement values for commissions received and commissions paid during the year.

**Commission per Transaction**

*Formula:*  

$$\frac{\text{Total Commission Revenue}}{\text{Transactions}}$$

The commission per transaction measures the typical dollar amount of commission for every transaction that occurs. Transactions included in the calculation are mail-in, with clearing firm, trails and all other transactions.

**Commission Payable Turnover**

*Formula:*  

$$\frac{\text{Commissions Paid}}{\text{Commissions Payable}}$$

This is a modified version of accounts payable turnover using commissions paid and total commissions payable at end of the year.

**Commission Payable—Days**

*Formula:*  

$$365 / (\text{Commissions Paid} / \text{Commissions Payable})$$

The median commission payable in days.

**Payout Ratio**

*Formula:*  

$$\frac{\text{Commissions Paid}}{\text{Commissions Received}}$$

The payout ratio is simply the ratio of commissions paid to commissions received based on financial statement data.

---

**Cash Flow Analysis**

Cash flow analysis looks at a broker-dealer's ability to generate operating cash flow from revenues and profits and the relationship of cash flow to assets and equity. Cash flow is a critical measure of a firm's ability to withstand an economic downturn, as well as measuring debt serviceability.

**Cash Conversion Efficiency**

*Formula:*  

$$\frac{\text{Operating Cash Flow}}{\text{Total Revenue}}$$

The cash conversion efficiency ratio measures the ability of revenue to generate operating cash flow. It indicates how much operating cash flow each dollar of revenue generates.

**Operating Cash Flow to Profit**

*Formula:*  

$$\frac{\text{Operating Cash Flow}}{\text{Net Income}}$$

Operating cash flow to profit indicates how much operating cash flow each dollar of profit (net income) generates.

**Operating Cash Flow  
Return on Assets  
(ROA)**

Formula:

$\frac{\text{Operating Cash Flow}}{\text{Total Assets}}$

Operating cash flow ROA measures the return on assets generated by operating cash flow.

**Operating Cash Flow  
Return on Equity  
(ROE)**

Formula:

$\frac{\text{Operating Cash Flow}}{\text{Total Equity}}$

Operating cash flow ROE measures the return on equity generated by operating cash flow.

---

**Common-Sized  
Statements**

Common-sized financial statements express each account as a percentage of either revenue (for the income statement) or total assets (for the balance sheet). The common-sized statements allow for a consistent comparison between firms and different historic periods and establish a relationship between revenue and expenses or between the items on the balance sheet. The common-sized financial statements for broker-dealers were calculated by taking the average value for all accounts and expressing them as a percentage of the average total.

# Common-Sized Income Statements

| Common-Sized Income Statement - All, High-Profit, and Non-High-Profit Broker-Dealers |                       |               |                       |               |                       |               |
|--------------------------------------------------------------------------------------|-----------------------|---------------|-----------------------|---------------|-----------------------|---------------|
|                                                                                      | All Broker-Dealers    |               | High-Profit: Top 25%  |               | Non-High-Profit       |               |
| <b>REVENUES</b>                                                                      |                       |               |                       |               |                       |               |
| Commission Received                                                                  |                       |               |                       |               |                       |               |
| Mutual Funds                                                                         | \$ 52,130,142         | 26.9%         | \$ 149,662,366        | 35.9%         | \$ 17,993,863         | 15.6%         |
| Equities                                                                             | 5,209,115             | 2.7%          | 10,440,523            | 2.5%          | 3,378,122             | 2.9%          |
| Annuities                                                                            | 4,060,747             | 2.1%          | 4,075,414             | 1.0%          | 4,055,614             | 3.5%          |
| Variable Annuities                                                                   | 22,170,277            | 11.5%         | 17,459,207            | 4.2%          | 23,819,151            | 20.7%         |
